Recommended by Binggen Zhang

A chemostat model with delayed response in growth and impulsive diffusion and input on nutrients is considered. Using the discrete dynamical system determined by the stroboscopic map, we obtain a microorganism-extinction periodic solution. Further, it is globally attractive. The permanent condition of the investigated system is also obtained by the theory on impulsive delay differential equation. Finally, numerical analysis is inserted to illustrate dynamical behaviors of the chemostat system. Our results reveal that the impulsive input amount of nutrients plays an important role on the outcome of the chemostat. Our results provide strategy basis for biochemical reaction management.

1. Introduction

The theory of impulsive differential equation appears as a natural description of several real processes subject to certain perturbations whose duration is negligible in comparison with the duration of the process. Recently, equations of this kind are found in almost every domain of applied science. Many examples are given in [1]. Some impulsive differential equations have been recently introduced in population dynamics [2–7], pulse vaccination [8–11], and chemostat dynamics [12–15].

The chemostat is a basic piece of laboratory apparatus. The advantages are that certain of the biological parameters assumed to influence the outcomes can be controlled by the experimenters. The chemostat plays an important role in bioprocessing, such as ecology, microbiology, chemical engineering, and so forth. Smith and Waltman had made discussion about the chemostat model in [16]. The models contain discrete time delays which account for time which laps between uptaked of nutrient and the assimilation of nutrient into viable biomass. Smith, Waltman [17] and Kuang [18] discussed various aspects of models with

discrete time delay. Freedman, So, and Waltman [19] were the first to incorporate time delay in chemostat models. Ellermeyer [20], Hsu et al. [21, 22], analyzed a discrete time delay model with two competitive microorganisms for a single nutrient in a chemostat. Hale, Somolinos [23], Hsu et al. [24], Wolkowicz, Zhao [25] investigated competition in chemostat. Ellermeyer et al. [26] did a theoretical and empirical investigation of delayed growth response in the continuous culture of bacteria. Delays occur naturally in biological system by two obvious sources of delays: delays due to the cell cycle; and delays due to the possibility the organism stores the nutrient. Delays appear in a chemostat model in Bush and Cook [27]. They have investigated a model of growth of one organism in the chemostat with a delay in the intrinsic growth rate of the microorganism but with no delay in the substrate equation.

In chemostat's simplest form, the system approximates conditions for plankton growth in lakes, where the limiting nutrients such as silica and phosphate are supplied from streams draining the watershed. In the lakes, the plankton population movements are subject to many factors, such as currents and turbulent lateral diffusion (cf. Levin and Segel [28], Mimura [29], Okubo [30], Freedman and Ruan [31]). Ruan [32] proposed a diffusive plankton-nutrient interaction model with delayed nutrient recycling and delayed growth response and studied Turing instability and the existence of travelling wave solutions. However, they did not investigate a chemostat model with delayed response in growth and impulsive diffusion on nutrients. Many researchers indicated that it was important to consider models with periodic perturbations, since these models may be quite naturally exposed in many real world phenomena, for instance, food supply, mating habits, cross flooding in rainstorm season. In fact, the perturbations such as cross flooding in rainstorm which are not suitable to be considered with continuity. These perturbations bring sudden changes to the system. Systems with sudden perturbations are involving an impulsive differential equations which have been studied intensively and systematically in [1, 2]. There are few papers [8, 12, 33, 34] research the chemostat model with impulsive perturbations on nutrients. In this paper, a chemostat model with delayed response in growth and impulsive diffusion on nutrients is investigated, we will obtain a microorganism-extinction periodic solution. Further, it is globally attractive. The permanent condition of the investigated system is also obtained.

The organizations of the paper are as following. In Section 2, we introduce a chemostat model with delayed response in growth and impulsive diffusion on nutrients. In Section 3, we present some preliminary results about the investigated model. Our main results are stated and proven in Section 4. Finally, the numerical analysis is inserted to illustrate the results, and conclude with a brief discussion in Section 5.

2. The Model

We investigate the following chemostat model with delayed response in growth and impulsive diffusion on nutrients:

$$\begin{aligned}\frac{ds_1(t)}{dt} &= D_1(s_1^0 - s_1(t)), \\ \frac{ds_2(t)}{dt} &= D_2(s_2^0 - s_2(t)) - P(s_2(t))x(t), & t \neq n\tau, \quad n = 1, 2, \dots, \\ \frac{dx(t)}{dt} &= -D_2x(t) + e^{-D_2\tau_1}P(s_2(t - \tau_1))x(t - \tau_1),\end{aligned}$$

$$\begin{aligned}
\Delta s_1(t) &= d(s_2(t) - s_1(t)) + \mu_1, \\
\Delta s_2(t) &= d(s_1(t) - s_2(t)), \quad t = n\tau, n = 1, 2, \dots, \\
\Delta x(t) &= 0, \\
(\varphi_1(\zeta), \varphi_2(\zeta), \varphi_3(\zeta)) &\in C_+ = C\left([-\tau_1, 0], \mathbb{R}_+^3\right), \quad \varphi_i(0) > 0, \quad i = 1, 2, 3,
\end{aligned} \tag{2.1}$$

where we suppose that the system is composed of two lakes connected by impulsive diffusion. $s_i(t)$ denotes the concentration of the nutrient in i th lake at time t ($i = 1, 2$). s_i^0 denotes the input nutrient concentration in i th lake ($i = 1, 2$). D_i denotes the input rate from the lakes containing the substrate and the wash-out rate of substrate and microorganism by products from Lake i ($i = 1, 2$). $0 < d < 1$ is diffusive rate between Lake 1 and Lake 2. It is assumed here that the net exchange from patch j to Lake i is proportional to the difference $s_j - s_i$ of concentration of the nutrient. $x(t)$ denotes the concentration of the microorganism in the second lake at time t . τ_1 stands for the time delay in conversion of nutrient to biomass for the microorganism. As discussed in [20, 32], $e^{-D_2\tau_1}x(t - \tau_1)$ represents the biomass of those microorganisms that consume nutrient τ_1 units of time prior to time t and that survive in the chemostat the τ_1 units of time necessary to complete the nutrient conversion process. $P(s_2(t))$ indicates the consumption rate of nutrient by the microorganism. It is assumed that $P(0) = 0$, $P'(0) > 0$ and $P''(0) \leq 0$. In particular, these hypotheses are satisfied by the Michaelis-Menten function $P(s_2(t)) = s_2(t)/(k + s_2(t))$, here $k > 0$ is the half-saturation constant or Michaelis-Menten constant. The impulsive diffusion occurs every τ period ($\tau > 0$), the system evolves from its initial state without being further affected by diffusion until the next pulse appears. $\Delta x = x(n\tau^+) - x(n\tau)$, and $x(n\tau^+)$ represents the concentration of the plankton in the i th lake immediately after the n th diffusion pulse at time $t = n\tau$, while $x(n\tau)$ represents the concentration of the microorganism in the i th lake before the n th diffusion pulse at time $t = n\tau$, $n \in \mathbb{Z}_+$. $\mu_1 \geq 0$ is the amount of the substrate concentration pulse at $t = n\tau$, $n \in \mathbb{Z}_+$ in first lake. The purpose of this paper is to prove that the system (2.1) has a microorganism-extinction periodic solution, further, it is globally attractive, and also prove system (2.1) is permanent.

3. The Lemmas

The solution of (2.1), denoted by $X(t) = (s_1(t), s_2(t), x(t))^T$, is a piecewise continuous function $X: \mathbb{R}_+ \rightarrow \mathbb{R}_+^3$. $X(t)$ is continuous on $(n\tau, (n+1)\tau]$, $n \in \mathbb{Z}_+$ and $X(n\tau^+) = \lim_{t \rightarrow n\tau^+} X(t)$ exists. Obviously the global existence and uniqueness of solutions of (2.1) is guaranteed by the smoothness properties of f , which denotes the mapping defined by right-side of system (2.1) [1]. Before having the main results. we need some lemmas which will be used in the next.

According to the biological meanings, it is assumed that $s_1(t) \geq 0$, $s_2(t) \geq 0$ and $x(t) \geq 0$. Now, we will show that all solutions of (2.1) are uniformly ultimately bounded.

Lemma 3.1. *There exists a constant $M > 0$ such that $s_1(t) \leq M$, $s_2(t) \leq M$, $x(t) \leq e^{-D\tau}M$, for each solution $(s_1(t), s_2(t), x(t))$ of (2.1) with all t large enough.*

Proof. Define $V(t) = s_1(t) + s_2(t) + e^{D_2\tau}x(t + \tau_1)$, and $D = \min\{D_1, D_2\}$. When $t \neq n\tau$, we have

$$\begin{aligned} D^+V(t) + DV(t) &= D_1s_1^0 + D_2s_2^0 - (D_1 - D)s_1(t) - (D_2 - D)s_2(t) - (D_2 - D)e^{-D_2\tau}x(t + \tau), \\ &< D_1s_1^0 + D_2s_2^0. \end{aligned} \quad (3.1)$$

When $t = n\tau$, $V(n\tau^+) = \mu_1$. By [1, lemma 2.2], for $t \in (n\tau, (n+1)\tau]$, we have

$$\begin{aligned} V(t) &\leq V(0)\exp(-Dt) + \int_0^t (D_1s_1^0 + D_2s_2^0)\exp(-D(t-s))ds + \sum_{0 < n\tau < t} \mu_1 \exp(-D(t-n\tau)) \\ &= V(0)\exp(-Dt) + \frac{D_1s_1^0 + D_2s_2^0}{D}(1 - \exp(-Dt)) \\ &\quad + \mu_1 \frac{\exp(-D(t-\tau)) - \exp(-D(t-(n+1)\tau))}{1 - \exp(D\tau)} \\ &< V(0)\exp(-Dt) + \frac{D_1s_1^0 + D_2s_2^0}{D}(1 - \exp(-Dt)) + \frac{\mu_1 \exp(-D(t-\tau))}{1 - \exp(D\tau)} + \frac{\mu_1 \exp(D\tau)}{\exp(D\tau) - 1} \\ &\rightarrow \frac{D_1s_1^0 + D_2s_2^0}{D} + \frac{\mu_1 \exp(D\tau)}{\exp(D\tau) - 1}, \quad \text{as } t \rightarrow \infty. \end{aligned} \quad (3.2)$$

So $V(t)$ is uniformly ultimately bounded. Hence, by the definition of $V(t)$, there exists a constant $M > 0$ such that $s_1(t) \leq M$, $s_2(t) \leq M$, $x(t) \leq e^{-D\tau}M$ for all t large enough. The proof is complete. \square

If $x(t) = 0$, the subsystem of (2.1) is written as

$$\begin{aligned} \frac{ds_1(t)}{dt} &= D_1(s_1^0 - s_1(t)), & t \neq n\tau, \quad n = 1, 2, \dots, \\ \frac{ds_2(t)}{dt} &= D_2(s_2^0 - s_2(t)), \\ \Delta s_1(t) &= d(s_2(t) - s_1(t)) + \mu_1, & t = n\tau, \quad n = 1, 2, \dots \\ \Delta s_2(t) &= d(s_1(t) - s_2(t)), \end{aligned} \quad (3.3)$$

Integrating and solving the first two equations of system (3.3) between pulses, we have

$$s_i(t) = s_i^0 - \left[s_i^0 - s_i(n\tau^+) \right] e^{-D_i(t-n\tau)}, \quad n\tau < t \leq (n+1)\tau \quad (i = 1, 2). \quad (3.4)$$

Considering the last two equations of system (3.3), we have the stroboscopic map of system (3.3) as follows:

$$\begin{aligned}
 s_1((n+1)\tau^+) &= (1-d)e^{-D_1\tau}s_1(n\tau^+) + de^{-D_2\tau}s_2(n\tau^+) \\
 &\quad + (1-d)\left(1 - e^{-D_1\tau}\right)s_1^0 + d\left(1 - e^{-D_2\tau}\right)s_2^0 + \mu_1, \\
 s_2((n+1)\tau^+) &= de^{-D_1\tau}s_1(n\tau^+) + (1-d)e^{-D_2\tau}s_2(n\tau^+) \\
 &\quad + d\left(1 - e^{-D_1\tau}\right)s_1^0 + (1-d)\left(1 - e^{-D_2\tau}\right)s_2^0.
 \end{aligned}
 \tag{3.5}$$

Equation (3.5) are difference equations. They describe the the concentration of the nutrients in the two lakes at a pulse in terms of values at the previous pulse. The dynamical behaviors of system (3.5) with equation (3.4) determine the dynamical behaviors of system (3.3). So we will devote to investigate system (3.5).

From system (3.5), we can easily have a unique fixed point of system (3.5) as follows

$$\begin{aligned}
 s_1^* &= \frac{[(1-d)(1 - e^{-D_1\tau}) - (1-2d)(1 - e^{-D_2\tau})e^{-D_1\tau}]s_1^0 - d(1 - e^{-D_2\tau})s_2^0}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-D_2\tau} - (1-2d)e^{-(D_1+D_2)\tau}} \\
 &\quad + \frac{(1 - e^{-D_2\tau} + de^{-D_2\tau})\mu_1}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-D_2\tau} - (1-2d)e^{-(D_1+D_2)\tau}}, \\
 s_2^* &= \frac{-d(1 - e^{-D_1\tau})s_1^0 + [(1-d)(1 - e^{-D_2\tau}) - (1-2d)(1 - e^{-D_1\tau})e^{-D_2\tau}]s_2^0}{1 - (1-d)e^{-D_2\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+D_1)\tau}} \\
 &\quad + \frac{de^{-D_1\tau}\mu_1}{1 - (1-d)e^{-D_2\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+D_1)\tau}}.
 \end{aligned}
 \tag{3.6}$$

To write system (3.5) as a map, we define the map $F : R_+^2 \rightarrow R_+^2$:

$$\begin{aligned}
 F_1(x) &= (1-d)e^{-D_1\tau}x_1 + de^{-D_2\tau}x_2 \\
 &\quad + (1-d)\left(1 - e^{-D_1\tau}\right)s_1^0 + d\left(1 - e^{-D_2\tau}\right)s_2^0 + \mu_1, \\
 F_2(x) &= de^{-D_1\tau}x_1 + (1-d)e^{-D_2\tau}x_2 \\
 &\quad + d\left(1 - e^{-D_1\tau}\right)s_1^0 + (1-d)\left(1 - e^{-D_2\tau}\right)s_2^0.
 \end{aligned}
 \tag{3.7}$$

$F(x)$ is the map evaluated at the point $x = (x_1, x_2) \in R_+^2$. Consequently, in system (3.4), F^n describes the concentration of the nutrients in the time $n\tau$.

Figure 1: Dynamical behavior of system (3.3) with $s_1(0) = 1$, $s_2(0) = 1$, $s_1^0 = 0.5$, $s_2^0 = 0.5$, $D = 0.6$, $d = 0.1$, $\tau = 2$, $\mu_1 = 0.3$. (a) time-series of $s_1(t)$, (b) time-series of $s_2(t)$, (c) The phase portrait of (3.3).

Doing similarly to [3, Lemma 4.1 and Theorem 4.1], and using iterative method, one can easily obtain Lemma 3.2 as follows:

Lemma 3.2. *For every point $(x_1, x_2) > (0, 0)$ of system (3.7), then one has*

$$F^n(x) \longrightarrow (s_1^*, s_2^*), \quad \text{as } n \longrightarrow \infty. \quad (3.8)$$

Remark 3.3. Lemma 3.2 implies that the fixed point (s_1^*, s_2^*) of F is globally stable. So all trajectories of (3.3) approach the positive periodic solution $(\widetilde{s}_1(t), \widetilde{s}_2(t))$ with period τ , where $\widetilde{s}_i(t) = s_i^0 - (s_i^0 - s_i^*)e^{-D_i(t-n\tau)}$, $n\tau < t \leq (n+1)\tau$, $(i = 1, 2)$. The dynamical behaviors of system (3.3) also can be shown from Figure 1.

Lemma 3.4 (see [18]). *Consider the following delay equation:*

$$y'(t) = a_1 y(t - \tau) - a_2 y(t), \tag{3.9}$$

where $a_1, a_2, \tau > 0$; $y(t) > 0$ for $-\tau \leq t \leq 0$. If $a_1 < a_2$, $\lim_{t \rightarrow \infty} y(t) = 0$.

4. Dynamical Behaviors of (2.1)

From the above discussion, we know that there exists a microorganism-extinction boundary periodic solution $(\widetilde{s_1(t)}, \widetilde{s_2(t)}, 0)$ of system (2.1). In this section, we will prove that the microorganism-extinction boundary periodic solution $(\widetilde{s_1(t)}, \widetilde{s_2(t)}, 0)$ of system (2.1) is globally attractive.

Theorem 4.1. *If*

$$\left[\frac{-d(1 - e^{-D_1\tau})s_1^0 + [(1 - d)(1 - e^{-D_2\tau}) - (1 - 2d)(1 - e^{-D_1\tau})e^{-D_2\tau}]s_2^0}{1 - (1 - d)e^{-D_2\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+D_1)\tau}} + \frac{de^{-D_1\tau}\mu_1}{1 - (1 - d)e^{-D_2\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+D_1)\tau}} \right] < P^{-1}(D_2e^{D_2\tau_1}), \tag{4.1}$$

holds, then the microorganism-extinction periodic solution $(\widetilde{s_1(t)}, \widetilde{s_2(t)}, 0)$ of system (2.1) is globally attractive.

Proof. Since

$$\left[\frac{-d(1 - e^{-D_1\tau})s_1^0 + [(1 - d)(1 - e^{-D_2\tau}) - (1 - 2d)(1 - e^{-D_1\tau})e^{-D_2\tau}]s_2^0}{1 - (1 - d)e^{-D_2\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+D_1)\tau}} + \frac{de^{-D_1\tau}\mu_1}{1 - (1 - d)e^{-D_2\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+D_1)\tau}} \right], \tag{4.2}$$

$$< P^{-1}(D_2e^{D_2\tau_1}),$$

then we can choose ε_0 sufficiently small such that

$$e^{-D_2\tau_1} P \left(\left[\frac{-d(1 - e^{-D_1\tau})s_1^0 + [(1 - d)(1 - e^{-D_2\tau}) - (1 - 2d)(1 - e^{-D_1\tau})e^{-D_2\tau}]s_2^0}{1 - (1 - d)e^{-D_2\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+D_1)\tau}} + \frac{de^{-D_1\tau}\mu_1}{1 - (1 - d)e^{-D_2\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+D_1)\tau}} \right] + \varepsilon_0 \right) < D_2. \tag{4.3}$$

It follows from that the first equation of system (2.1) that $ds_2(t)/dt \leq D_2(s_2^0 - s_2(t))$. So we consider the following comparison impulsive differential system:

$$\begin{aligned} \frac{dx_1(t)}{dt} &= D_1(s_1^0 - x_1(t)), \\ \frac{dx_2(t)}{dt} &= D_2(s_2^0 - x_2(t)), & t \neq n\tau, \\ \Delta x_1(t) &= d(x_2(t) - x_1(t)) + \mu_1, \\ \Delta x_2(t) &= d(x_1(t) - x_2(t)), & t = n\tau, \\ x_1(0^+) &= s_1(0^+), \\ x_2(0^+) &= s_2(0^+). \end{aligned} \quad (4.4)$$

In view of Remark 3.3, we obtain the periodic solution of system (4.4)

$$\widetilde{x_i(t)} = s_i^0 - (s_i^0 - x_i^*)e^{-D_i(t-n\tau)}, \quad n\tau < t \leq (n+1)\tau \quad (i = 1, 2) \quad (4.5)$$

which is globally asymptotically stable. Here

$$\begin{aligned} x_1^* &= \frac{[(1-d)(1-e^{-D_1\tau}) - (1-2d)(1-e^{-D_2\tau})e^{-D_1\tau}]s_1^0 - d(1-e^{-D_2\tau})s_2^0}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-D_2\tau} - (1-2d)e^{-(D_1+D_2)\tau}} \\ &\quad + \frac{(1-e^{-D_2\tau} + de^{-D_2\tau})\mu_1}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-D_2\tau} - (1-2d)e^{-(D_1+D_2)\tau}}, \\ x_2^* &= \frac{-d(1-e^{-D_1\tau})s_1^0 + [(1-d)(1-e^{-D_2\tau}) - (1-2d)(1-e^{-D_1\tau})e^{-D_2\tau}]s_2^0}{1 - (1-d)e^{-D_2\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+D_1)\tau}} \\ &\quad + \frac{de^{-D_1\tau}\mu_1}{1 - (1-d)e^{-D_2\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+D_1)\tau}}. \end{aligned} \quad (4.6)$$

From Remark 3.3 and comparison theorem of impulsive equation [1], we have $s_i(t) \leq x_i(t)$ ($i = 1, 2$), and $x_i(t) \rightarrow \widetilde{s_i(t)}$ ($i = 1, 2$) as $t \rightarrow \infty$. Then there exists an integer $k'_2 > k_1$, $t > k'_2$ such that

$$s_i(t) \leq x_i(t) \leq \widetilde{s_i(t)} + \varepsilon_0, \quad n\tau < t \leq (n+1)\tau, \quad n > k'_2, \quad (i = 1, 2), \quad (4.7)$$

that is,

$$s_2(t) < \widetilde{s_2(t)} + \varepsilon_0 \leq s_2^* + \varepsilon_0 \triangleq \varrho, \quad n\tau < t \leq (n+1)\tau, \quad n > k'_2. \quad (4.8)$$

From the third equation of system (2.1), we get

$$\frac{dx(t)}{dt} \leq e^{-D_2\tau_1}P(\varrho)x(t - \tau_1) - D_2x(t), \quad t > n\tau + \tau_1, \quad n > k_2. \quad (4.9)$$

Considering the following comparison differential system:

$$\frac{dy(t)}{dt} = e^{-D_2\tau_1}P(\varrho)y(t - \tau_1) - D_2y(t), \quad t > n\tau + \tau_1, \quad n > k_2, \quad (4.10)$$

we have $e^{-D_2\tau_1}P(\varrho) < D_2$. According to Lemma 3.4, we have $\lim_{t \rightarrow \infty} y(t) = 0$.

Let $(s_1(t), s_2(t), x(t))$ be the solution of system (2.1) with initial conditions and $x(\zeta) = \varphi_3(\zeta)$ ($\zeta \in [-\tau_1, 0]$), $y(t)$ is the solution of system (4.10) with initial conditions $x(\zeta) = \varphi_3(\zeta)$ ($\zeta \in [-\tau_1, 0]$). By the comparison theorem, we have

$$\lim_{t \rightarrow \infty} x(t) < \lim_{t \rightarrow \infty} y(t) = 0. \quad (4.11)$$

Incorporating into the positivity of $x(t)$, we know that $\lim_{t \rightarrow \infty} x(t) = 0$. Therefore, for any $\varepsilon_1 > 0$ (sufficiently small), there exists an integer $k_3(k_3\tau > k_2\tau + \tau_1)$ such that $x(t) < \varepsilon_1$ for all $t > k_3\tau$.

For system (2.1), we have

$$D_2 \left(s_2^0 - \left(1 + \frac{\varepsilon_1 P'(0)}{D_2} \right) s_2(t) \right) \leq \frac{ds_2(t)}{dt} \leq D_2 (s_2^0 - s_2(t)), \quad (4.12)$$

Then we have $z_1(t) \leq s_1(t) \leq z_2(t)$, $z'_1(t) \leq s_2(t) \leq z'_2(t)$ and $z_1(t) \rightarrow \widetilde{s_1(t)}$, $z_2(t) \rightarrow \widetilde{s_2(t)}$, $z'_1(t) \rightarrow \widetilde{s'_1(t)}$, $z'_2(t) \rightarrow \widetilde{s'_2(t)}$ as $t \rightarrow \infty$. While $(z_1(t), z_2(t))$ and $(z'_1(t), z'_2(t))$ are the solutions of

$$\begin{aligned} \frac{dz_1(t)}{dt} &= D_1 (s_1^0 - z_1(t)), \quad t \neq n\tau, \\ \frac{dz_2(t)}{dt} &= D_2 \left[s_2^0 - \left(1 + \frac{\varepsilon_1 P'(0)}{D_2} \right) z_2(t) \right], \quad t \neq n\tau, \\ z_1(t^+) &= d(z_2(t) - z_1(t)) + \mu_1, \quad t = n\tau, \\ z_2(t^+) &= d(z_1(t) - z_2(t)), \quad t = n\tau, \\ z_1(0^+) &= s_1(0^+), \\ z_2(0^+) &= s_2(0^+), \\ \frac{dz'_1(t)}{dt} &= D_1 (s_1^0 - z'_1(t)), \quad t \neq n\tau, \\ \frac{dz'_2(t)}{dt} &= D_2 (s_2^0 - z'_2(t)), \quad t \neq n\tau, \\ z_1(t^+) &= d(z_2(t) - z_1(t)) + \mu_1, \quad t = n\tau, \\ z_2(t^+) &= d(z_1(t) - z_2(t)), \quad t = n\tau, \\ z_1(0^+) &= s_1(0^+), \\ z_2(0^+) &= s_2(0^+), \end{aligned} \quad (4.13)$$

respectively. For $n\tau < t \leq (n + 1)\tau$, $\widetilde{z_1}(t) = s_1^0 - (s_1^0 - z_1^*)e^{-D_1(t-n\tau)}$ and $\widetilde{z_2}(t) = D_2s_2^0 / (D_2 + \varepsilon_1P'(0)) - (D_2s_2^0 / (D_2 + \varepsilon_1P'(0)) - z_2^*)e^{-(D_2+\varepsilon_1P'(0))(t-n\tau)}$, where

$$\begin{aligned}
 z_1^* &= \frac{\left[(1-d)(1-e^{-D_1\tau}) - (1-2d)\left(1-e^{-(D_2+\varepsilon_1P'(0))\tau}\right)e^{-D_1\tau} \right] s_1^0 - d\left(1-e^{-(D_2+\varepsilon_1P'(0))\tau}\right)\rho}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-(D_2+\varepsilon_1P'(0))\tau} - (1-2d)e^{-(D_1+D_2+\varepsilon_1P'(0))\tau}} \\
 &+ \frac{\left(1-e^{-(D_2+\varepsilon_1P'(0))\tau} + de^{-(D_2+\varepsilon_1P'(0))\tau}\right)\mu_1}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-(D_2+\varepsilon_1P'(0))\tau} - (1-2d)e^{-(D_1+D_2+\varepsilon_1P'(0))\tau}}, \\
 z_2^* &= \frac{-d(1-e^{-D_1\tau})s_1^0 + \left[(1-d)\left(1-e^{-(D_2+\varepsilon_1P'(0))\tau}\right) - (1-2d)(1-e^{-D_1\tau})e^{-(D_2+\varepsilon_1P'(0))\tau} \right]\rho}{1 - (1-d)e^{-(D_2+\varepsilon_1P'(0))\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+\varepsilon_1P'(0)+D_1)\tau}} \\
 &+ \frac{de^{-D_1\tau}\mu_1}{1 - (1-d)e^{-(D_2+\varepsilon_1P'(0))\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+\varepsilon_1P'(0)+D_1)\tau}}, \tag{4.14}
 \end{aligned}$$

where ρ denotes $D_2s_2^0 / (D_2 + \varepsilon_1P'(0))$. Therefore, for any $\varepsilon_2 > 0$, there exists a integer $k_4, n > k_4$ such that $\widetilde{z_1}(t) - \varepsilon_2 < s_1(t) < \widetilde{s_1}(t) + \varepsilon_2, \widetilde{z_2}(t) - \varepsilon_2 < s_2(t) < \widetilde{s_2}(t) + \varepsilon_2$. Let $\varepsilon_1 \rightarrow 0$, so we have $\widetilde{s_1}(t) - \varepsilon_2 < s_1(t) < \widetilde{s_1}(t) + \varepsilon_2, \widetilde{s_2}(t) - \varepsilon_2 < s_2(t) < \widetilde{s_2}(t) + \varepsilon_2$, for t large enough, which implies $s_1(t) \rightarrow \widetilde{s_1}(t), s_2(t) \rightarrow \widetilde{s_2}(t)$ as $t \rightarrow \infty$. This completes the proof. \square

Definition 4.2. System (2.1) is said to be permanent, if there are constants $m, M > 0$ (independent of initial value) and a finite time T_0 such that for all solutions $(s_1(t), s_2(t), x(t))$ with all initial values $s_1(t) > 0, s_2(t) > 0, x(0^+) > 0, m \leq s_1(t) < M, m \leq s_2(t) < M, m \leq x(t) \leq e^{-D_2\tau}M$, holds for all $t \geq T_0$. Here T_0 may depend on the initial values $(s_1(0^+), s_2(0^+), x(0^+))$.

Theorem 4.3. *If*

$$\begin{aligned}
 &\left[\frac{-d(1-e^{-D_1\tau})s_1^0 + \left[(1-d)\left(1-e^{-(D_2+x^*P'(0))\tau}\right) - (1-2d)(1-e^{-D_1\tau})e^{-(D_2+x^*P'(0))\tau} \right]\mathcal{R}}{1 - (1-d)e^{-(D_2+x^*P'(0))\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right. \\
 &+ \left. \frac{de^{-D_1\tau}\mu_1}{1 - (1-d)e^{-(D_2+x^*P'(0))\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right] \tag{4.15} \\
 &> P^{-1}\left(D_2e^{D_2\tau_1}\right),
 \end{aligned}$$

where \mathcal{R} denotes $D_2s_2^0 / (D_2 + x^*P'(0))$, holds, then there is a positive constant q such that each positive solution $(s_1(t), s_2(t), x(t))$ of (2.1) satisfies $x(t) \geq q$, for t large enough. Where x^* is determined by

the following equation

$$\begin{aligned}
 & P \left[\frac{-d(1 - e^{-D_1\tau})s_1^0 + \left[(1 - d) \left(1 - e^{-(D_2+x^*P'(0))\tau} \right) - (1 - 2d)(1 - e^{-D_1\tau})e^{-(D_2+x^*P'(0))\tau} \right] \mathcal{R}}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right. \\
 & \quad \left. + \frac{de^{-D_1\tau}\mu_1}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right] \\
 & = D_2e^{D_2\tau_1}.
 \end{aligned} \tag{4.16}$$

Proof. The third equation of system (2.1) can be rewritten as

$$\frac{dx(t)}{dt} = \left[e^{-D_2\tau_1}P(s_2(t)) - D_2 \right] x(t) - e^{-D_2\tau_1} \frac{d}{dt} \int_{t-\tau_1}^t P(s_2(u))x(u)du. \tag{4.17}$$

Let us consider any positive solution $(s_1(t), s_2(t), x(t))$ of system (2.1). According to(4.14), $V(t)$ is defined as

$$V(t) = x(t) + e^{-D_2\tau_1} \int_{t-\tau_1}^t P(s(u))x(u)du. \tag{4.18}$$

We calculate the derivative of $V(t)$ along the solution of (2.1):

$$\frac{dV(t)}{dt} = \left[e^{-D_2\tau_1}P(s_2(t)) - D_2 \right] x(t). \tag{4.19}$$

Since

$$\begin{aligned}
 & \left[\frac{-d(1 - e^{-D_1\tau})s_1^0 + \left[(1 - d) \left(1 - e^{-(D_2+x^*P'(0))\tau} \right) - (1 - 2d)(1 - e^{-D_1\tau})e^{-(D_2+x^*P'(0))\tau} \right] \mathcal{R}}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right. \\
 & \quad \left. + \frac{de^{-D_1\tau}\mu_1}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right] \\
 & > P^{-1} \left(D_2e^{D_2\tau_1} \right),
 \end{aligned} \tag{4.20}$$

then we can easily know that there exists sufficiently small $\varepsilon > 0$ such that

$$\begin{aligned}
 P & \left[\frac{-d(1 - e^{-D_1\tau})s_1^0 + \left[(1-d)\left(1 - e^{-(D_2+x^*P'(0))\tau}\right) - (1-2d)(1 - e^{-D_1\tau})e^{-(D_2+x^*P'(0))\tau} \right] \mathcal{R}}{1 - (1-d)e^{-(D_2+x^*P'(0))\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right. \\
 & \left. + \frac{de^{-D_1\tau}\mu_1}{1 - (1-d)e^{-(D_2+x^*P'(0))\tau} - (1-d)e^{-D_1\tau} - (1-2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} - \varepsilon \right] \\
 & > D_2e^{D_2\tau_1}.
 \end{aligned} \tag{4.21}$$

We claim that for any $t_0 > 0$, it is impossible that $x(t) < x^*$ for all $t > t_0$. Suppose that the claim is not valid. Then there is a $t_0 > 0$ such that $x(t) < x^*$ for all $t > t_0$. It follows from the second equation of (2.1) that for all $t > t_0$,

$$\frac{ds_2(t)}{dt} > (D_2 + x^*P'(0)) \left[\frac{D_2s_2^0}{D_2 + x^*P'(0)} - s_2(t) \right]. \tag{4.22}$$

Consider the following comparison impulsive system for all $t > t_0$:

$$\begin{aligned}
 \frac{dv_1(t)}{dt} & = D_1(s_1^0 - v_1(t)), \quad t \neq n\tau, \\
 \frac{dv_2(t)}{dt} & = (D_2 + x^*P'(0)) \left[\frac{D_2s_2^0}{D_2 + x^*P'(0)} - v_2(t) \right], \quad t \neq n\tau, \\
 \Delta v_1(t) & = d(v_2(t) - v_1(t)) + \mu_1, \quad t = n\tau, \\
 \Delta v_2(t) & = d(v_1(t) - v_2(t)), \quad t = n\tau, \\
 v_1(0^+) & = s_1(0^+), \\
 v_2(0^+) & = s_2(0^+).
 \end{aligned} \tag{4.23}$$

By Lemma 3.5, we obtain $\widetilde{v_1(t)} = s_1^0 - (s_1^0 - v_1^*)e^{-D_1(t-n\tau)}$, $\widetilde{v_2(t)} = D_2s_2^0/(D_2 + x^*P'(0)) - (D_2s_2^0/(D_2 + x^*P'(0)) - v_2^*)e^{-(D_2+x^*P'(0))(t-n\tau)}$, $n\tau < t \leq (n+1)\tau$, is the unique positive periodic solution of (4.22) which is globally asymptotically stable, where,

$$\begin{aligned}
 v_1^* & = \frac{\left[(1-d)(1 - e^{-D_1\tau}) - (1-2d)\left(1 - e^{-(D_2+x^*P'(0))\tau}\right)e^{-D_1\tau} \right] s_1^0 - d\left(1 - e^{-(D_2+x^*P'(0))\tau}\right) \mathcal{R}}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-(D_2+x^*P'(0))\tau} - (1-2d)e^{-(D_1+D_2+x^*P'(0))\tau}} \\
 & \quad + \frac{\left(1 - e^{-(D_2+x^*P'(0))\tau} + de^{-(D_2+x^*P'(0))\tau}\right) \mu_1}{1 - (1-d)e^{-D_1\tau} - (1-d)e^{-(D_2+x^*P'(0))\tau} - (1-2d)e^{-(D_1+D_2+x^*P'(0))\tau}}
 \end{aligned}$$

$$v_2^* = \frac{-d(1 - e^{-D_1\tau})s_1^0 + \left[(1 - d)\left(1 - e^{-(D_2+x^*P'(0))\tau}\right) - (1 - 2d)(1 - e^{-D_1\tau})e^{-(D_2+x^*P'(0))\tau} \right] \mathcal{R}}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}}$$

$$+ \frac{de^{-D_1\tau}\mu_1}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}}.$$
(4.24)

By the comparison theorem for impulsive differential equation [1], we know that there exists $t_1 (> t_0 + \tau_1)$ such that the inequality $s_2(t) \geq v_2^*(t) - \varepsilon$ holds for $t \geq t_1$, thus $s_2(t) \geq v_2^* - \varepsilon$ for all $t \geq t_1$. For convenience, we make notation as $\sigma \triangleq v_2^* - \varepsilon$. So we have

$$e^{-D_2\tau_1}P(\sigma) > D_2, \tag{4.25}$$

then we have

$$V'(t) > x(t) \left[e^{-D_2\tau_1}P(\sigma) - D_2 \right], \tag{4.26}$$

for all $t > t_1$. Set $x^m = \min_{t \in [t_1, t_1 + \tau_1]} x(t)$, we will show that $x(t) \geq x^m$ for all $t \geq t_1$. Suppose the contrary, then there is a $T_0 > 0$ such that $x(t) \geq x^m$ for $t_1 \leq t \leq t_1 + \tau_1 + T_0$, $x(t_1 + \tau_1 + T_0) = x^m$ and $x'(t_1 + \tau_1 + T_0) < 0$. Hence, the first equation of system (1.1) imply that

$$x'(t_1 + \tau_1 + T_0) = e^{-D_2\tau_1}P(s(t_1 + \tau_1 + T_0)x(t_1 + \tau_1 + T_0) - D_2x(t_1 + \tau_1 + T_0)),$$

$$\geq \left[e^{-D_2\tau_1}P(\sigma) - D_2 \right] x^m > 0. \tag{4.27}$$

This is a contradiction. Thus, $x(t) \geq x^m$ for all $t > t_1$. As a consequence, Then $V'(t) > x^m [e^{-D_2\tau_1}P(\sigma) - D_2] > 0$ for all $t > t_1$. This implies that as $t \rightarrow \infty$, $V(t) \rightarrow \infty$. It is a contradiction to $V(t) \leq M(1 + \tau_1 e^{-2D_2\tau_1}P(M))$. Hence, the claim is complete.

By the claim, we are left to consider two case. First, $x(t) \geq x^*$ for all t large enough. Second, $x(t)$ oscillates about x^* for t large enough.

Define

$$q = \min \left\{ \frac{x^*}{2}, q_1 \right\}, \tag{4.28}$$

where $q_1 = x^*e^{-D_2\tau_1}$. We hope to show that $x(t) \geq q$ for all t large enough. The conclusion is evident in first case. For the second case, let $t^* > 0$ and $\xi > 0$ satisfy $x(t^*) = x(t^* + \xi) = x^*$ and $x(t) < x^*$ for all $t^* < t < t^* + \xi$ where t^* is sufficiently large such that $x(t) > \sigma$ for $t^* < t < t^* + \xi$, $x(t)$ is uniformly continuous. The positive solutions of (2.1) are ultimately bounded and $x(t)$ is not affected by impulses. Hence, there is a $T(0 < t < \tau_1$ and T is dependent of the choice of t^*) such that $x(t^*) > x^*/2$ for $t^* < t < t^* + T$. If $\xi < T$, there is nothing to prove. Let us consider the case $T < \xi < \tau_1$. Since $x'(t) > -D_2x(t)$ and $x(t^*) = x^*$, it is clear that $x(t) \geq q_1$ for $t \in [t^*, t^* + \tau_1]$. Then, proceeding exactly as the proof for the above claim. We see that $x(t) \geq q_1$ for $t \in [t^* + \tau_1, t^* + \xi]$. Because the kind of interval $t \in [t^*, t^* + \xi]$ is chosen in an arbitrary way

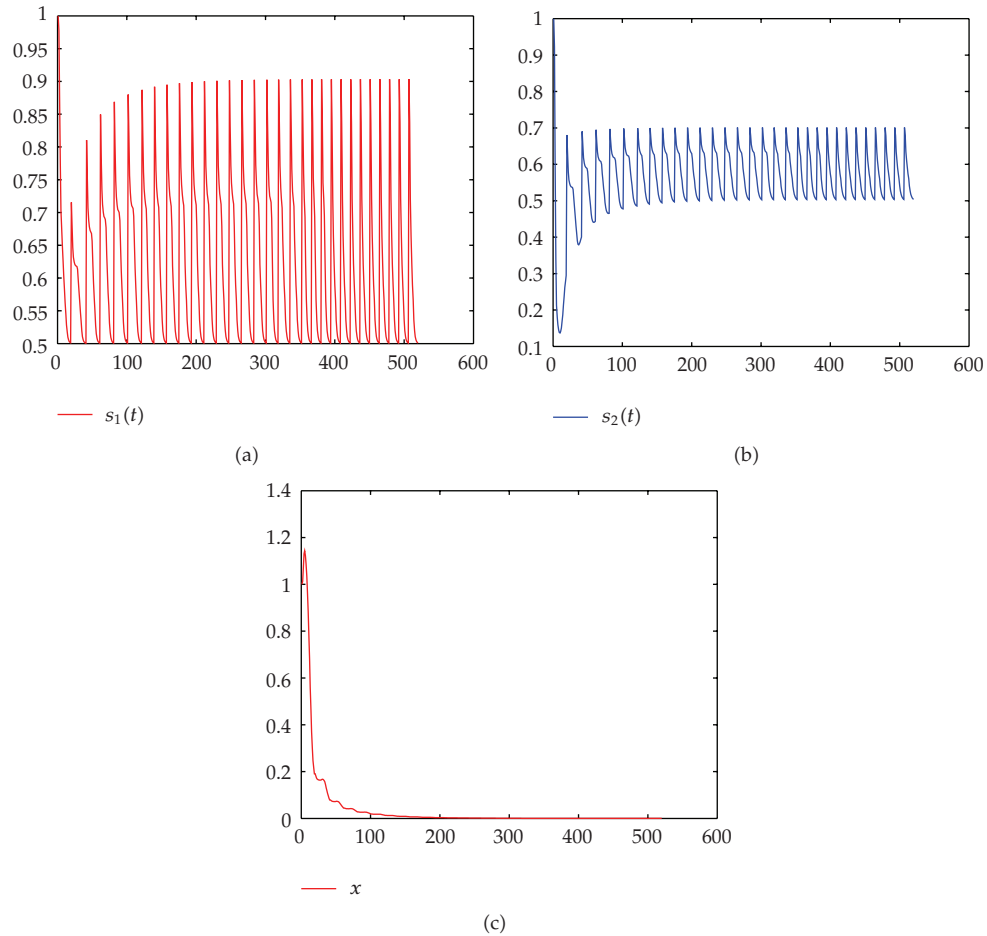

Figure 2: Dynamical behavior of system (2.1) on microorganism-extinction periodic solution with $s_1(0) = 1, s_2(0) = 1, x(0) = 1, s_1^0 = 0.5, s_2^0 = 0.5, D_1 = 0.6, D_2 = 0.4, k = 2, \tau = 1, \beta = 2.5, \tau_1 = 1, d = 0.9, \mu_1 = 0.4$. (a) time-series of $s_1(t)$, (b) time-series of $s_2(t)$, (c) time-series of $x(t)$.

(we only need t^* to be large). We conclude $x(t) \geq q$ for all large t . In the second case. In view of above discussion, the choice of q is independent of the positive solution, and we proved that any positive solution of (2.1) satisfies $x(t) \geq q$ for all sufficiently large t . This completes the proof of the theorem. \square

Theorem 4.4. *If*

$$\left[\frac{-d(1 - e^{-D_1\tau})s_1^0 + \left[(1 - d)\left(1 - e^{-(D_2+x^*P'(0))\tau}\right) - (1 - 2d)(1 - e^{-D_1\tau})e^{-(D_2+x^*P'(0))\tau} \right] \mathcal{R}}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right] + \frac{de^{-D_1\tau}\mu_1}{1 - (1 - d)e^{-(D_2+x^*P'(0))\tau} - (1 - d)e^{-D_1\tau} - (1 - 2d)e^{-(D_2+x^*P'(0)+D_1)\tau}} \right] > P^{-1}(D_2e^{D_2\tau_1}), \tag{4.29}$$

then system (2.1) is permanent.

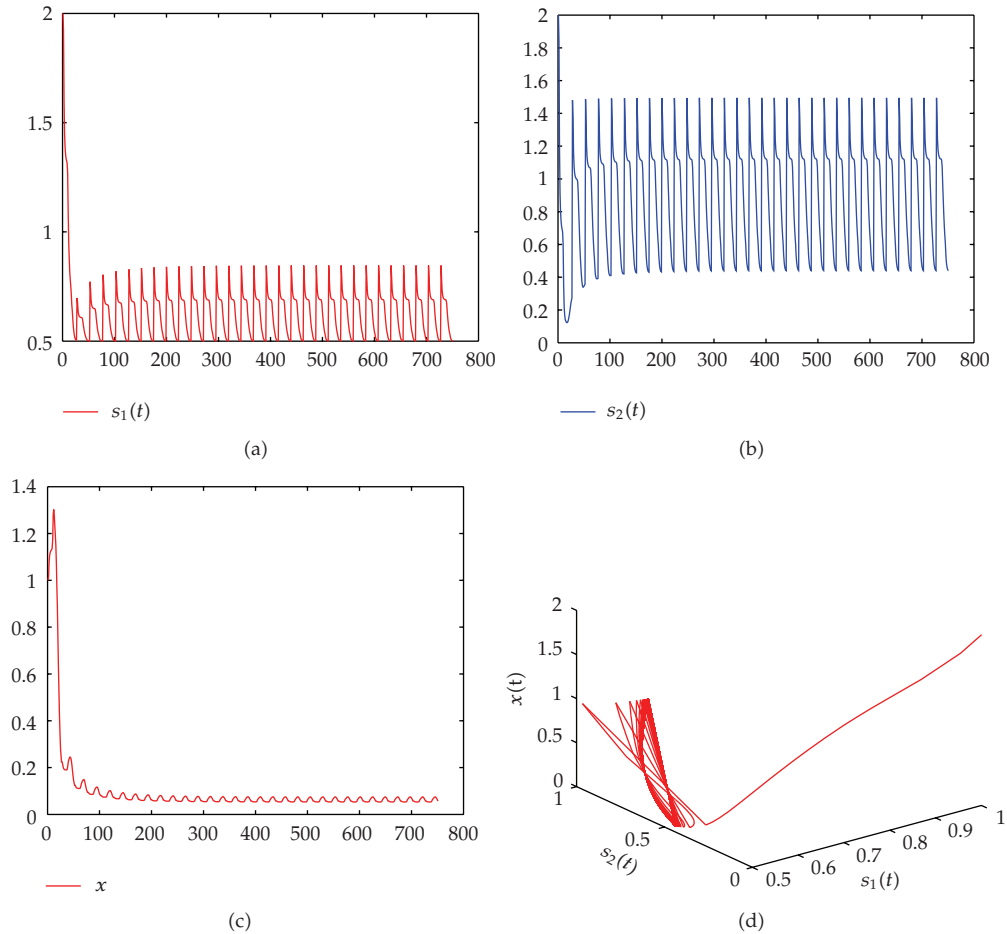

Figure 3: Dynamical behavior of the permanence of system (2.1) with $s_1(0) = 1, s_2(0) = 1, x(0) = 1, s_1^0 = 0.5, s_2^0 = 0.5, D_1 = 0.6, D_2 = 0.4, k = 2, \tau = 1, \beta = 2.5, \tau_1 = 1, d = 0.9, \mu_1 = 0.4$. (a) Time-series of $s_1(t)$. (b) Time-series of $s_2(t)$. (c) time-series of $x(t)$, (d) The phase portrait of the permanence of (2.1).

We can easily complete the proof of Theorem 4.4 by referring to Lemma 3.1, Theorems 4.1 and 4.3.

5. Discussion

In this paper, we investigate a delayed chemostat model with impulsive diffusion and input on nutrients. From Theorems 4.1 and 4.4, we analyze that the microorganism-extinction periodic solution of system (2.1) is globally attractive, and System (2.1) is also proved to be permanent. If it is assumed that the consumption rate of nutrient by the plankton is $P(s_2(t)) = \beta s_2(t) / (k + s_2(t))$, and $s_1(0) = 1, s_2(0) = 1, x(0) = 1, s_1^0 = 0.5, s_2^0 = 0.5, D_1 = 0.6, D_2 = 0.4, k = 2, \tau = 1, \beta = 2.5, \tau_1 = 1, d = 0.9, \mu_1 = 0.4$. Then the microorganism-extinction periodic solution is globally attractive (see Figure 2). If it is also assumed that the consumption rate of nutrient by the plankton is $P(s_2(t)) = \beta s_2(t) / (k + s_2(t))$, and $s_1(0) = 1, s_2(0) = 1, x(0) = 1, s_1^0 = 0.5, s_2^0 = 0.5, D_1 = 0.6, D_2 = 0.4, k = 2, \tau = 1, \beta = 2.5, \tau_1 = 1,$

$d = 0.9$, $\mu_1 = 2$. then system (2.1) is permanence (see Figure 3). From Theorems 4.1 and 4.4, and the numerical analysis, we can easily guess that there must exist a threshold μ_1^* . If $\mu_1 < \mu_1^*$, the microorganism-extinction periodic solution $(s_1(t), s_2(t), 0)$ of (2.1) is globally attractive. If $\mu_1 > \mu_1^*$, system (2.1) is permanent. The sameness can be discussed on parameter d , then, the impulsive diffusion amount also plays an important role for the permanence of system (2.1). Our results provide strategy basis for biochemical reaction management.
