We consider the Bernstein polynomials on $\mathbb{Z}_{p}$ and investigate some interesting properties of Bernstein polynomials related to Stirling numbers and Bernoulli numbers.

## 1. Introduction

Let $C[0,1]$ denote the set of continuous function on $[0,1]$. Then, Bernstein operator for $f \in$ $C[0,1]$ is defined as

$$
\begin{equation*}
B_{n}(f)(x)=\sum_{k=0}^{n} f\left(\frac{k}{n}\right)\binom{n}{k} x^{k}(1-x)^{n-k}=\sum_{k=0}^{n} f\left(\frac{k}{n}\right) B_{k, n}(x) \tag{1.1}
\end{equation*}
$$

for $k, n \in \mathbb{Z}$, where $B_{k, n}(x)=\binom{n}{k} x^{k}(1-x)^{n-k}$ is called Bernstein polynomial of degree $n$. Some researchers have studied the Bernstein polynomials in the area of approximation theory (see [1-6]).

Let $p$ be a fixed prime number. Throughout this paper $\mathbb{Z}_{p}, \mathbb{Q}_{p}, \mathbb{C}$, and $\mathbb{C}_{p}$ will, respectively, denote the ring of $p$-adic rational integers, the field of $p$-adic rational numbers, the complex number field, and the completion of algebraic closure of $\mathbb{Q}_{p}$. Let $U D\left(\mathbb{Z}_{p}\right)$ be the
set of uniformly differentiable function on $\mathbb{Z}_{p}$. For $f \in U D\left(\mathbb{Z}_{p}\right)$, the $p$-adic $q$-integral on $\mathbb{Z}_{p}$ is defined by

$$
\begin{equation*}
\int_{\mathbb{Z}_{p}} f(x) d \mu(x)=\lim _{N \rightarrow \infty} \frac{1}{p^{N}} \sum_{x=0}^{p^{N}-1} f(x) \tag{1.2}
\end{equation*}
$$

(see [4, 7-15]).
In the special case, if we set $f(x)=x^{n}$ in (1.2), we have

$$
\begin{equation*}
B_{n}=\int_{\mathbb{Z}_{p}} x^{n} d \mu(x) \tag{1.3}
\end{equation*}
$$

In this paper, we consider Bernstein polynomials on $\mathbb{Z}_{p}$ and we investigate some interesting properties of Bernstein polynomials related to Stirling numbers and Bernoulli numbers.

## 2. Bernstein Polynomials Related to Stirling Numbers and Bernoulli Numbers

In this section, for $f \in U D\left(\mathbb{Z}_{p}\right)$, we consider Bernstein type operator on $\mathbb{Z}_{p}$ as follows:

$$
\begin{equation*}
B_{n}(f)(x)=\sum_{k=0}^{n} f\left(\frac{k}{n}\right)\binom{n}{k} x^{k}(1-x)^{n-k}=\sum_{k=0}^{n} f\left(\frac{k}{n}\right) B_{k}(x), \tag{2.1}
\end{equation*}
$$

for $n \in \mathbb{Z}_{+}$, where $B_{k, n}(x)=\binom{n}{k} x^{k}(1-x)^{n-k}$ is called Bernstein polynomial of degree $n$. We consider Newton's forward difference operator as follows:

$$
\begin{align*}
\Delta f(x) & =f(x+1)-f(x) \\
\Delta^{n} f(x) & =\sum_{k=0}^{n}\binom{n}{k}(-1)^{n}-k f(x+k)=\sum_{k=0}^{n}\binom{n}{k}(-1)^{k} f(x+n-k) \tag{2.2}
\end{align*}
$$

For $x=0$,

$$
\begin{equation*}
\Delta^{n} f(0)=\sum_{k=0}^{n}\binom{n}{k}(-1)^{k} f(n-k)=\sum_{n=0}^{\infty}\binom{n}{k}(-1)^{n-k} f(k) \tag{2.3}
\end{equation*}
$$

Then, we have

$$
\begin{equation*}
f(n)=(1+\Delta)^{n} f(0)=\sum_{l=0}^{n}\binom{n}{l} \Delta^{l} f(0) \tag{2.4}
\end{equation*}
$$

From (2.4), we note that

$$
\begin{equation*}
f(x)=\sum_{n=0}^{\infty}\binom{x}{n} \Delta^{n} f(0), \tag{2.5}
\end{equation*}
$$

where

$$
\begin{equation*}
\Delta^{n} f(0)=\sum_{k=0}^{n}\binom{n}{k}(-1)^{k} f(n-k) . \tag{2.6}
\end{equation*}
$$

The Stirling number of the first kind is defined by

$$
\begin{equation*}
\prod_{k=1}^{n}(1+k z)=\sum_{k=0}^{n} S_{1}(n, k) z^{k}, \tag{2.7}
\end{equation*}
$$

and the Stirling number of the second kind is also defined by

$$
\begin{equation*}
\prod_{k=1}^{n}\left(\frac{1}{1+k z}\right)=\sum_{k=0}^{n} S_{2}(n, k) z^{k} . \tag{2.8}
\end{equation*}
$$

By (2.5), (2.6), (2.7), and (2.8), we see that

$$
\begin{equation*}
S_{2}(n, k)=\frac{1}{k!} \sum_{j=0}^{k}(-1)^{j}\binom{k}{j}(k-j)^{n} \tag{2.9}
\end{equation*}
$$

where $\Delta^{n} 0^{m}=\sum_{k=0}^{n}\binom{n}{k}(-1)^{k}(n-k)^{m}$. Note that, for $k \in \mathbb{Z}_{+}$and $x \in[0,1]$,

$$
\begin{align*}
F^{(k)}(t, x) & =\frac{t^{k} e^{(1-x) t} x^{k}}{k!}=x^{k} \sum_{n=0}^{\infty}\binom{n+k}{k}(1-x)^{n} \frac{t^{n+k}}{(n+k)!}  \tag{2.10}\\
& =\sum_{n=k}^{\infty}\binom{n}{k} x^{k}(1-x)^{n-k} \frac{t^{n}}{(n)!}=\sum_{n=0}^{\infty} B_{k, n}(x) \frac{t^{n}}{n!} .
\end{align*}
$$

Thus, we note that $t^{k} e^{(1-x) t} x^{k} / k$ ! is the generating function of Bernstein polynomial. It is easy to show that

$$
\begin{equation*}
\frac{1}{\binom{n}{k}} \int_{\mathbb{Z}_{p}} B_{k, n}(x) d \mu(x)=\sum_{l=0}^{n-k}\binom{n-k}{l}(-1)^{l} \int_{\mathbb{Z}_{p}} x^{l+k} d \mu(x)=\sum_{l=0}^{n-k}\binom{n-k}{l}(-1)^{l} B_{n+k} . \tag{2.11}
\end{equation*}
$$

By (2.11), we obtain the following theorem.

Theorem 2.1. For $n, k \in \mathbb{Z}_{+}$with $n \geq k$, one has

$$
\begin{equation*}
\frac{1}{\binom{n}{k}} \int_{\mathbb{Z}_{p}} B_{k, n}(x) d \mu(x)=\sum_{m=0}^{\infty} \sum_{l=0}^{n-k}\binom{n-k}{l}(-1)^{l} B_{n+k} \tag{2.12}
\end{equation*}
$$

where $B_{n}$ are the nth Bernoulli numbers.
In [12], it is known that

$$
\begin{gather*}
x^{n}=\sum_{k=0}^{n}\binom{x}{k} k!S_{2}(n, k),  \tag{2.13}\\
\sum_{k=i-1}^{n} \frac{\binom{k}{i}}{\binom{n}{i}} B_{k, n}(x)=x^{i}, \tag{2.14}
\end{gather*}
$$

for $i \in \mathbb{N}$. By (1.1) and (2.14), we see that

$$
\begin{gather*}
x^{i}=\sum_{m=0}^{\infty}\binom{n-i+m-1}{m}(-1)^{m} x^{n-i-m}(1-x)^{m} \sum_{k=i-1}^{n} \frac{\binom{k}{i}}{\binom{n}{i}} B_{k, n}(x) \\
=\sum_{m=0}^{\infty} \sum_{k=i-1}^{n} \frac{\binom{k}{i}}{\binom{n}{i}}\binom{n-i+m-1}{m}\binom{n}{k}(-1)^{m} x^{n-i-m+k}(1-x)^{n+m-k}  \tag{2.15}\\
=\sum_{m=0}^{\infty} \sum_{k=i}^{n} \sum_{l=0}^{n+m-k}\binom{n-i+m-1}{m}\binom{n+m-k}{l}\binom{n}{k} \\
\times(-1)^{l+m} x^{l+n-i-m+k},
\end{gather*}
$$

for $i \in \mathbb{N}$. By (2.15), we obtain the following theorem.
Theorem 2.2. For $n, k \in \mathbb{Z}_{+}$, and $i \in \mathbb{N}$, one has

$$
\begin{equation*}
B_{i}=\sum_{m=0}^{\infty} \sum_{k=i}^{n} \sum_{l=0}^{m+n-k}\binom{n-i+m-1}{m}\binom{m+n-k}{l}\binom{n}{k}(-1)^{l+m} B_{l+n-i-m+k} \tag{2.16}
\end{equation*}
$$

From (2.13) and (2.14), we note that

$$
\begin{equation*}
\sum_{k=i-1}^{n} \frac{\binom{k}{i}}{\binom{n}{i}} B_{k, n}(x)=\sum_{k=0}^{i}\binom{x}{k} k!S_{2}(i, k) \tag{2.17}
\end{equation*}
$$

In [16], it is known that

$$
\begin{equation*}
\int_{\mathbb{Z}_{p}}\binom{x}{n} d \mu(x)=\frac{1}{n+1} \tag{2.18}
\end{equation*}
$$

By (2.17), (2.18), and Theorem 2.2, we have

$$
\begin{equation*}
B_{n}=\sum_{k=0}^{m} \frac{k!}{k+1}(-1)^{k} S_{2}(k, n-k) \tag{2.19}
\end{equation*}
$$

From the definition of the Stirling numbers of the first kind, we drive that

$$
\begin{equation*}
\binom{x}{n} n!=(x)_{n}=\sum_{k=0}^{n} S_{1}(n, k) x^{k} . \tag{2.20}
\end{equation*}
$$

By (2.17), (2.19), and (2.20), we obtain the following theorem.
Theorem 2.3. For $k, n \in \mathbb{Z}_{+}$and $i \in \mathbb{N}$, one has

$$
\begin{equation*}
\sum_{k=i-1}^{n} \frac{\binom{k}{i}}{\binom{n}{i}} B_{k, n}(x)=\sum_{k=0}^{i} \sum_{l=0}^{k} S_{1}(n, l) S_{2}(i, k) x^{l} \tag{2.21}
\end{equation*}
$$

By Theorems 2.2 and 2.3, we obtain the following corollary.
Corollary 2.4. For $k \in \mathbb{N}$, one has

$$
\begin{equation*}
B_{i}(x)=\sum_{k=0}^{i} \sum_{l=0}^{k} S_{1}(n, l) S_{2}(i, k) B_{l} \tag{2.22}
\end{equation*}
$$

where $B_{i}$ are the ith Bernoulli numbers.
