# EXISTENCE FOR A CLASS OF DISCRETE HYPERBOLIC PROBLEMS 

RODICA LUCA

Received 1 November 2005; Revised 10 March 2006; Accepted 7 April 2006

We investigate the existence and uniqueness of solutions to a class of discrete hyperbolic systems with some nonlinear extreme conditions and initial data, in a real Hilbert space.

## 1. Introduction

Let $H$ be a real Hilbert space with the scalar product $\langle\cdot, \cdot\rangle$ and the associated norm $\|\cdot\|$. In this paper we will investigate the discrete hyperbolic system

$$
\begin{array}{ll}
\frac{d u_{j}}{d t}(t)+\frac{v_{j}(t)-v_{j-1}(t)}{h_{j}}+A\left(u_{j}(t)\right) \ni f_{j}(t), \\
\frac{d v_{j}}{d t}(t)+\frac{u_{j+1}(t)-u_{j}(t)}{h_{j}}+B\left(v_{j}(t)\right) \ni g_{j}(t), & j=\overline{1, N}, t \in[0, T], \text { in } H, \tag{S}
\end{array}
$$

with the extreme conditions

$$
\begin{equation*}
v_{0}(t)=-\alpha\left(u_{1}(t)\right), \quad u_{N+1}(t)=\beta\left(v_{N}(t)\right), \quad t \in[0, T] \tag{EC}
\end{equation*}
$$

and the initial data

$$
\begin{equation*}
u_{j}(0)=u_{j 0}, \quad v_{j}(0)=v_{j 0}, \quad j=\overline{1, N}, \tag{ID}
\end{equation*}
$$

where $N \in \mathbb{N}, h_{j}>0, j=\overline{1, N}$, and $\alpha, \beta, A, B$ are operators in $H$, which satisfy some assumptions.

2 Existence for a class of discrete hyperbolic problems
This problem is a discrete version with respect to $x$ (with $H=\mathbb{R}$ ) of the problem

$$
\begin{align*}
& \frac{\partial u}{\partial t}(t, x)+\frac{\partial v}{\partial x}(t, x)+A(u(t, x)) \ni f(t, x), \\
& \frac{\partial v}{\partial t}(t, x)+\frac{\partial u}{\partial x}(t, x)+B(v(t, x)) \ni g(t, x), \tag{S}
\end{align*}
$$

with the boundary conditions

$$
\begin{equation*}
v(t, 0)=-\bar{\alpha}(u(t, 0)), \quad u(t, 1)=\bar{\beta}(v(t, 1)), \quad t>0, \tag{BC}
\end{equation*}
$$

and the initial data

$$
\begin{equation*}
u(0, x)=u_{0}(x), \quad v(0, x)=v_{0}(x), \quad 0<x<1 . \tag{IC}
\end{equation*}
$$

The above problem has applications in electrotechnics (the propagation phenomena in electrical networks) and mechanics (the variable flow of a fluid)-see [7, 8, 13]. The system $(S)$ subject to various boundary conditions has been studied by many authors: Barbu, Iftimie, Moroşanu, and Luca, in [4, 5, 9, 11, 12]. Using an idea from [14] we discretize the problem $(S)+(B C)+(I C)$ in this way: let $N$ be a given integer $(N \geq 1)$ and $h=1 /(N+1)$. In a first stage we approximate the system $(S)$ and the boundary conditions (BC) by

$$
\begin{gather*}
\frac{\partial u}{\partial t}(t, x)+\frac{v(t, x)-v(t, x-h)}{h}+A(u(t, x)) \ni f(t, x), \quad x \in(h,(N+1) h), \\
\frac{\partial v}{\partial t}(t, x)+\frac{u(t, x+h)-u(t, x)}{h}+B(v(t, x)) \ni g(t, x), \quad x \in(0, N h), t>0,  \tag{1.1}\\
v(t, 0)=-\bar{\alpha}(u(t, 0)), \quad u(t, N h)=\bar{\beta}(v(t, N h)) .
\end{gather*}
$$

We look for $u$ and $v$ of the form $u(t, x)=\sum_{j=0}^{N} u_{j}(t) \varphi_{j}(x)$ and $v(t, x)=\sum_{j=0}^{N} v_{j}(t) \varphi_{j}(x)$, where

$$
\varphi_{j}(x)=\chi_{[j h,(j+1) h)}(x)= \begin{cases}1, & x \in[j h,(j+1) h),  \tag{1.2}\\ 0, & x \notin[j h,(j+1) h) .\end{cases}
$$

We write $f, g, u_{0}, v_{0}$ as

$$
\begin{array}{rlrl}
f(t, x)=\sum_{j=0}^{N} f_{j}(t) \varphi_{j}(x), & g(t, x) & =\sum_{j=0}^{N} g_{j}(t) \varphi_{j}(x), \\
u_{0}(x) & =\sum_{j=0}^{N} u_{j 0} \varphi_{j}(x), & v_{0}(x) & =\sum_{j=0}^{N} v_{j 0} \varphi_{j}(x), \tag{1.3}
\end{array}
$$

where $f_{j}(t)=f(t, j h), g_{j}(t)=g(t, j h), u_{j 0}=u_{0}(j h)$, and $v_{j 0}=v_{0}(j h)$.

Then for $u_{j}$ and $v_{j}$ we obtain the system

$$
\begin{gather*}
u_{j}^{\prime}+\frac{v_{j}-v_{j-1}}{h}+A\left(u_{j}\right) \ni f_{j}, \quad j=\overline{1, N},  \tag{1.4}\\
v_{j}^{\prime}+\frac{u_{j+1}-u_{j}}{h}+B\left(v_{j}\right) \ni g_{j}, \quad j=\overline{0, N-1},
\end{gather*}
$$

with the conditions $v_{0}=-\bar{\alpha}\left(u_{0}\right), u_{N}=\bar{\beta}\left(v_{N}\right), u_{j}(0)=u_{j 0}, j=\overline{1, N}$, and $v_{j}(0)=v_{j 0}, j=$ $\overline{0, N-1}$.

For a unitary writing, we take $j=\overline{1, N-1}$ in both equations of the above system and then the extreme conditions become $v_{0}=-\bar{\alpha}\left(u_{1}\right)$ and $u_{N}=\bar{\beta}\left(v_{N-1}\right)$ (they do not show $u_{0}$ and $\left.v_{N}\right)$. By passing $N \rightarrow N+1$ and taking different steps $h_{j}$, we obtain the system ( $\bar{S}$ ) in $u_{j}, v_{j}, j=\overline{1, N}$ with $v_{0}=-\bar{\alpha}\left(u_{1}\right), u_{N+1}=\bar{\beta}\left(v_{N}\right)(\alpha=\bar{\alpha}, \beta=\bar{\beta})$, and $H=\mathbb{R}$.

In this way the study of the partial differential system $(S)$ reduces to the study of the ordinary differential system $(\bar{S})$ (with $H=\mathbb{R}$ and $h_{j}=h$, for all $j$ ). The solution $u_{j}, v_{j}$ depends on $h$ and it seems that $\tilde{u}(t, x)=\sum u_{j}(t) \varphi_{j}(x), \tilde{v}(t, x)=\sum v_{j}(t) \varphi_{j}(x)$ approximate the solution $u, v$ of the system $(S)$. We will not study here the convergence of the solution $\tilde{u}, \tilde{v}$ to $u, v$, but we will investigate the well-posedness of the discrete problem $(\bar{S})+(\overline{E C})+$ $(\overline{I D})$.

We will also study the discrete system that corresponds to $(S)$ for $x \in(0, \infty)$ with the boundary condition

$$
\begin{equation*}
v(t, 0)=-\bar{\alpha}(u(t, 0)), \quad t>0 \tag{BC}
\end{equation*}
$$

and initial data

$$
\begin{equation*}
u(0, x)=u_{0}(x), \quad v(0, x)=v_{0}(x), \quad x>0 . \tag{IC}
\end{equation*}
$$

More precisely we will investigate the infinite discrete hyperbolic system

$$
\begin{gather*}
\frac{d u_{n}}{d t}+\frac{v_{n}-v_{n-1}}{h}+A\left(u_{n}\right) \ni f_{n},  \tag{S}\\
\frac{d v_{n}}{d t}+\frac{u_{n+1}-u_{n}}{h}+B\left(v_{n}\right) \ni g_{n}, \quad n=1,2, \ldots, t \in[0, T], \text { in } H,
\end{gather*}
$$

with the extreme condition

$$
\begin{equation*}
v_{0}(t)=-\alpha\left(u_{1}(t)\right), \quad t \in[0, T], \tag{EC}
\end{equation*}
$$

and initial data

$$
\begin{equation*}
u_{n}(0)=u_{n 0}, \quad v_{n}(0)=v_{n 0}, \quad n=1,2, \ldots . \tag{ID}
\end{equation*}
$$

Although the proposed problems appeared by discretization of the problem $(S)+$ $(B C)+(I C)$ and the corresponding one for $x \in(0, \infty)$, our problems also cover some nonlinear differential systems in Hilbert spaces.

4 Existence for a class of discrete hyperbolic problems
For other classes of difference and differential equations in abstract spaces we refer the reader to $[1,2,10]$.

In Section 2 we recall some definitions and results from the theory of maximal monotone operators that we need to prove our results. In Sections 3 and 4 we study the problems $(\bar{S})+(\overline{E C})+(\overline{I D})$ and $(\widetilde{S})+(\widetilde{E C})+(\widetilde{I D})$.

## 2. Notations and preliminaries

Let $H$ be a real Hilbert space with the scalar product $\langle\cdot, \cdot\rangle$ and the associated norm $\|\cdot\|$. We denote by $\rightarrow$ and $\rightarrow$ the strong and weak convergence in $H$, respectively. For a multivalued operator $A: H \rightarrow H$ we denote by $D(A)=\{x \in H ; A(x) \neq \varnothing\}$ its domain and by $R(A)=\cup\{A(x) ; x \in D(A)\}$ its range. The operator $A$ is identified with its graph $G(A)=\{[x, y] \in H \times H ; x \in D(A), y \in R(A)\} \subset H \times H$.

We use for $A$ the notation $A: D(A) \subset H \rightarrow H$. If $A, B \subset H \rightarrow H$ and $\lambda \in \mathbb{R}$ then

$$
\begin{array}{cc}
\lambda A=\{[x, \lambda y] ; y \in A(x)\}, & D(\lambda A)=D(A), \\
A+B=\{[x, y+z] ; y \in A(x), z \in A(x)\}, & D(A+B)=D(A) \cap D(B) . \tag{2.1}
\end{array}
$$

The operator $A: D(A) \subset H \rightarrow H$ is monotone if for all $x_{1}, x_{2} \in D(A)$ and $y_{1} \in A\left(x_{1}\right)$, $y_{2} \in A\left(x_{2}\right)$ we have $\left\langle y_{1}-y_{2}, x_{1}-x_{2}\right\rangle \geq 0$.

An operator $A: H \rightarrow H$ single-valued and everywhere defined is hemicontinuous if for all $x, y \in H$ we have $A(x+t y)-A(x)$, as $t \rightarrow 0$. The operator $A: D(A) \subset H \rightarrow H$ is demicontinuous if it is strongly weakly continuous, that is, if $\left(\left[x_{n}, y_{n}\right]\right)_{n} \subset A$ with $x_{n} \rightarrow x$, as $n \rightarrow \infty$ and $y_{n}-y$, as $n \rightarrow \infty$, then $[x, y] \in A$.

A demicontinuous operator is also hemicontinuous.
The operator $A: D(A) \subset H \rightarrow H$ is maximal monotone if it is maximal in the set of all monotone operators, that is, $A$ is monotone and, as subset of $H \times H$, it is not properly contained in any other monotone subset of $H \times H$.

The monotone operator $A: D(A) \subset H \rightarrow H$ is maximal monotone if and only if for any $\lambda>0$ (equivalently for some $\lambda>0$ ), $R(I+\lambda A)=H$.

If $A: H \rightarrow H$ is everywhere defined, single-valued, monotone, and hemicontinuous, then it is maximal monotone.

If $A: D(A) \subset H \rightarrow H$ is maximal monotone and $B: H \rightarrow H$ is everywhere defined, single-valued, monotone, and hemicontinuous, then $A+B$ is maximal monotone.

For a maximal monotone operator $A: D(A) \subset H \rightarrow H$, the operators

$$
\begin{equation*}
J_{\lambda}=(I+\lambda A)^{-1}: H \longrightarrow H, \quad \lambda>0, \quad A_{\lambda}=\frac{1}{\lambda}\left(I-J_{\lambda}\right): H \longrightarrow H, \quad \lambda>0 \tag{2.2}
\end{equation*}
$$

are the resolvent and the Yosida approximation of $A$.
For an operator $A: D(A) \subset H \rightarrow H, f:(0, \infty) \rightarrow H$ and $u_{0} \in H$, we consider the Cauchy problem

$$
\begin{equation*}
\frac{d u}{d t}(t)+A(u(t)) \ni f(t), \quad t>0, u(0)=u_{0} \tag{CP}
\end{equation*}
$$

The function $u \in C([0, T] ; H)$ is strong solution for the problem $(C P)$ if $u$ is absolutely continuous on every compact of $(0, T), u(t) \in D(A)$, for a.a. $t \in(0, T), u(0)=u_{0}$, and $u$ satisfies $(C P)_{1}$ for a.a. $t \in(0, T)$.

The function $u \in C([0, T] ; H)$ is weak solution for the problem $(C P)$ if there exist $\left(u_{n}\right)_{n} \subset W^{1, \infty}(0, T ; H)$ and $\left(f_{n}\right)_{n} \subset L^{1}(0, T ; H)$ such that

$$
\begin{equation*}
\frac{d u_{n}}{d t}(t)+A\left(u_{n}(t)\right) \ni f_{n}(t), \quad \text { for a.a. } t \in(0, T), n=1,2, \ldots \tag{2.3}
\end{equation*}
$$

$u_{n} \rightarrow u$, as $n \rightarrow \infty$, in $C([0, T] ; H), u(0)=u_{0}$, and $f_{n} \rightarrow f$, as $n \rightarrow \infty$, in $L^{1}(0, T ; H)$.
For other properties of the maximal monotone operators and for the main results of existence, uniqueness of the strong and weak solutions for the nonlinear evolution equations in Hilbert spaces, we refer the reader to $[3,6,13]$.

## 3. The problem $(\bar{S})+(\overline{E C})+(\overline{I D})$

The assumptions we will use in this section are the following.
(H1) The operators $A: D(A) \subset H \rightarrow H, B: D(B) \subset H \rightarrow H$ are maximal monotone, possibly multivalued, with $D(A) \neq \varnothing, D(B) \neq \varnothing$.
(H2) The operators $\alpha, \beta: H \rightarrow H$ are single-valued and maximal monotone.
(H3) The constants $h_{j}>0, j=\overline{1, N}$.
We will write our problem as a Cauchy problem in a certain Hilbert space, for we consider the Hilbert space $X=H^{2 N}=\left\{\left(u_{1}, u_{2}, \ldots, u_{N}, v_{1}, v_{2}, \ldots, v_{N}\right)^{T} ; u_{j}, v_{j} \in H, j=\overline{1, N}\right\}$ with the scalar product

$$
\begin{equation*}
\left\langle\left(u_{1}, \ldots, u_{N}, v_{1}, \ldots, v_{N}\right)^{T},\left(\bar{u}_{1}, \ldots, \bar{u}_{N}, \bar{v}_{1}, \ldots, \bar{v}_{N}\right)^{T}\right\rangle_{X}=\sum_{j=1}^{N} h_{j}\left(\left\langle u_{j}, \bar{u}_{j}\right\rangle+\left\langle v_{j}, \bar{v}_{j}\right\rangle\right) \tag{3.1}
\end{equation*}
$$

and the corresponding norm $\|\cdot\|_{X}$.
We introduce the operator $\mathscr{A}: D(\mathscr{A}) \subset X \rightarrow X$,

$$
\begin{align*}
& \mathscr{A}\left(\left(u_{1}, u_{2}, \ldots, u_{N}, v_{1}, v_{2}, \ldots, v_{N}\right)^{T}\right) \\
& \quad=\left(\frac{v_{1}+\alpha\left(u_{1}\right)}{h_{1}}, \frac{v_{2}-v_{1}}{h_{2}}, \ldots, \frac{v_{N}-v_{N-1}}{h_{N}}, \frac{u_{2}-u_{1}}{h_{1}}, \frac{u_{3}-u_{2}}{h_{2}}, \ldots, \frac{\beta\left(v_{N}\right)-u_{N}}{h_{N}}\right)^{T} . \tag{3.2}
\end{align*}
$$

Because $D(\alpha)=D(\beta)=H$, we deduce that $D(\mathscr{A})=X$.
We also define the operator $\mathscr{B}: D(\mathscr{B}) \subset X \rightarrow X, D(\mathscr{B})=D(A)^{N} \times D(B)^{N}$,

$$
\begin{align*}
& \mathscr{B}\left(\left(u_{1}, u_{2}, \ldots, u_{N}, v_{1}, v_{2}, \ldots, v_{N}\right)^{T}\right) \\
& \quad=\left\{\left(\gamma_{1}, \gamma_{2}, \ldots, \gamma_{N}, \delta_{1}, \delta_{2}, \ldots, \delta_{N}\right)^{T} ; \gamma_{i} \in A\left(u_{i}\right), \delta_{i} \in B\left(v_{i}\right), i=\overline{1, N}\right\} . \tag{3.3}
\end{align*}
$$

6 Existence for a class of discrete hyperbolic problems
Using the operators $\mathscr{A}$ and $\mathscr{B}$, our problem can be equivalently expressed as the following Cauchy problem in the space $X$

$$
\begin{equation*}
\frac{d U}{d t}(t)+\mathscr{A}(U(t))+\mathscr{B}(U(t)) \ni F(t), \quad U(0)=U_{0} \tag{P}
\end{equation*}
$$

where $U=\left(u_{1}, u_{2}, \ldots, u_{N}, v_{1}, \ldots, v_{N}\right)^{T}, \quad U_{0}=\left(u_{10}, u_{20}, \ldots, u_{N 0}, v_{10}, \ldots, v_{N 0}\right)^{T}, F=\left(f_{1}\right.$, $\left.f_{2}, \ldots, f_{N}, g_{1}, \ldots, g_{N}\right)^{T}$.

Lemma 3.1. If the assumptions (H2) and (H3) hold, then the operator $\mathscr{A}$ is monotone and demicontinuous; so it is maximal monotone.

Proof. The operator $\mathscr{A}$ is defined on $X$ and it is single-valued. $\mathscr{A}$ is monotone, because

$$
\begin{align*}
\langle\mathscr{A}(U) & -\mathscr{A}(\bar{U}), U-\bar{U}\rangle_{X} \\
= & \sum_{j=1}^{N} h_{j}\left\langle\frac{v_{j}-v_{j-1}-\bar{v}_{j}+\bar{v}_{j-1}}{h_{j}}, u_{j}-\bar{u}_{j}\right\rangle \\
& +\sum_{j=1}^{N} h_{j}\left\langle\frac{u_{j+1}-u_{j}-\bar{u}_{j+1}+\bar{u}_{j}}{h_{j}}, v_{j}-\bar{v}_{j}\right\rangle \\
= & \left\langle v_{1}+\alpha\left(u_{1}\right)-\bar{v}_{1}-\alpha\left(\bar{u}_{1}\right), u_{1}-\bar{u}_{1}\right\rangle \\
& +\sum_{j=2}^{N}\left(\left\langle v_{j}-\bar{v}_{j}, u_{j}-\bar{u}_{j}\right\rangle-\left\langle v_{j-1}-\bar{v}_{j-1}, u_{j}-\bar{u}_{j}\right\rangle\right)  \tag{3.4}\\
& +\sum_{j=1}^{N-1}\left(\left\langle u_{j+1}-\bar{u}_{j+1}, v_{j}-\bar{v}_{j}\right\rangle-\left\langle u_{j}-\bar{u}_{j}, v_{j}-\bar{v}_{j}\right\rangle\right) \\
& +\left\langle\beta\left(v_{N}\right)-u_{N}-\beta\left(\bar{v}_{N}\right)+\bar{u}_{N}, v_{N}-\bar{v}_{N}\right\rangle \\
= & \left\langle v_{1}-\bar{v}_{1}, u_{1}-\bar{u}_{1}\right\rangle+\left\langle\alpha\left(u_{1}\right)-\alpha\left(\bar{u}_{1}\right), u_{1}-\bar{u}_{1}\right\rangle \\
& -\left\langle u_{1}-\bar{u}_{1}, v_{1}-\bar{v}_{1}\right\rangle+\left\langle v_{N}-\bar{v}_{N}, u_{N}-\bar{u}_{N}\right\rangle \\
& +\left\langle\beta\left(v_{N}\right)-\beta\left(\bar{v}_{N}\right), v_{N}-\bar{v}_{N}\right\rangle-\left\langle u_{N}-\bar{u}_{N}, v_{N}-\bar{v}_{N}\right\rangle \\
= & \left\langle\alpha\left(u_{1}\right)-\alpha\left(\bar{u}_{1}\right), u_{1}-\bar{u}_{1}\right\rangle+\left\langle\beta\left(v_{N}\right)-\beta\left(\bar{v}_{N}\right), v_{N}-\bar{v}_{N}\right\rangle \geq 0,
\end{align*}
$$

with $v_{0}=-\alpha\left(u_{1}\right), \bar{v}_{0}=-\alpha\left(\bar{u}_{1}\right), u_{N+1}=\beta\left(v_{N}\right), \bar{u}_{N+1}=\beta\left(\bar{v}_{N+1}\right)$, for all $U=\left(u_{1}, u_{2}\right.$, $\left.\ldots, u_{N}, v_{1}, \ldots, v_{N}\right)^{T}, \bar{U}=\left(\bar{u}_{1}, \bar{u}_{2}, \ldots, \bar{u}_{N}, \bar{v}_{1}, \ldots, \bar{v}_{N}\right)^{T} \in X$.

The operator $\mathscr{A}$ is also demicontinuous, that is, if $U^{n} \rightarrow U^{0}$ and $\mathscr{A}\left(U^{n}\right)-V^{0}$, then $V^{0}=\mathscr{A}\left(U^{0}\right)$. Indeed, let $U^{n}=\left(u_{1}^{n}, u_{2}^{n}, \ldots, u_{N}^{n}, v_{1}^{n}, \ldots, v_{N}^{n}\right), U^{0}=\left(u_{1}^{0}, u_{2}^{0}, \ldots, u_{N}^{0}, v_{1}^{0}, \ldots, v_{N}^{0}\right)$, $U^{n} \rightarrow U^{0}$ and $\mathscr{A}\left(U^{n}\right)=\left(\left(v_{1}^{n}+\alpha\left(u_{1}^{n}\right)\right) / h_{1},\left(v_{2}^{n}-v_{1}^{n}\right) / h_{2}, \ldots,\left(v_{N}^{n}-v_{N-1}^{n}\right) / h_{N},\left(u_{2}^{n}-u_{1}^{n}\right) /\right.$ $\left.h_{1}, \ldots,\left(\beta\left(v_{N}^{n}\right)-u_{N}^{n}\right) / h_{N}\right)^{T}, V^{0}=\left(x_{1}^{0}, x_{2}^{0}, \ldots, x_{N}^{0}, y_{1}^{0}, \ldots, y_{N}^{0}\right)^{T}, \mathscr{A}\left(U^{n}\right)-V^{0}$.

From $U^{n} \rightarrow U^{0}$ we deduce that

$$
\begin{equation*}
u_{j}^{n} \longrightarrow u_{j}^{0}, \quad v_{j}^{n} \longrightarrow v_{j}^{0}, \quad \text { for } n \longrightarrow \infty, \forall j=\overline{1, N} . \tag{3.5}
\end{equation*}
$$

Because $\mathscr{A}\left(U^{n}\right)-V^{0}$, we get $\left\langle\mathscr{A}\left(U^{n}\right), Y\right\rangle_{X} \rightarrow\left\langle V^{0}, Y\right\rangle_{X}$, for all $Y \in X, Y=\left(\alpha_{1}, \alpha_{2}, \ldots, \alpha_{N}\right.$, $\left.\beta_{1}, \ldots, \beta_{N}\right)^{T}$, that is,

$$
\begin{gather*}
\left\langle v_{1}^{n}+\alpha\left(u_{1}^{n}\right), \alpha_{1}\right\rangle \longrightarrow h_{1}\left\langle x_{1}^{0}, \alpha_{1}\right\rangle, \\
\left\langle v_{j}^{n}-v_{j-1}^{n}, \alpha_{j}\right\rangle \longrightarrow h_{j}\left\langle x_{j}^{0}, \alpha_{j}\right\rangle, \quad j=\overline{2, N}, \\
\left\langle u_{j}^{n}-u_{j-1}^{n}, \beta_{j-1}\right\rangle \longrightarrow h_{j-1}\left\langle y_{j-1}^{0}, \beta_{j-1}\right\rangle, \quad j=\overline{2, N},  \tag{3.6}\\
\left.\left\langle\beta\left(v_{N}^{n}\right)-u_{N}^{n}, \beta_{N}\right\rangle \longrightarrow v_{1}^{n}+\alpha\left(u_{1}^{n}\right) \longrightarrow h_{1} x_{1}^{0}, \beta_{N}\right\rangle, \quad \text { in } H, \\
v_{j}^{n}-v_{j-1}^{n} \longrightarrow h_{j} x_{j}^{0}, \quad j=\overline{2, N},  \tag{3.7}\\
u_{j}^{n}-u_{j-1}^{n} \longrightarrow h_{j-1} y_{j-1}^{0}, \quad j=\overline{2, N}, \\
\beta\left(v_{N}^{n}\right)-u_{N}^{n} \longrightarrow h_{N} y_{N}^{0}, \quad \text { in } H, \text { as } n \longrightarrow \infty . \tag{3.8}
\end{gather*}
$$

From the relations (3.5) and (3.7) we obtain $x_{j}^{0}=\left(v_{j}^{0}-v_{j-1}^{0}\right) / h_{j}, j=\overline{2, N}, y_{j-1}^{0}=\left(u_{j}^{0}-\right.$ $\left.u_{j-1}^{0}\right) / h_{j-1}, j=\overline{2, N}$. Because $\alpha$ and $\beta$ are demicontinuous, by (3.5), (3.6), and (3.8) we deduce
$h_{1} x_{1}^{0}-v_{1}^{0}=\alpha\left(u_{1}^{0}\right), \quad h_{N} y_{N}^{0}+u_{N}^{0}=\beta\left(v_{N}^{0}\right) \Longrightarrow x_{1}^{0}=\frac{v_{1}^{0}+\alpha\left(u_{1}^{0}\right)}{h_{1}}, \quad y_{N}^{0}=\frac{\beta\left(v_{N}^{0}\right)-u_{N}^{0}}{h_{N}}$.

Therefore $V^{0}=\mathscr{A}\left(U^{0}\right)$. Hence the operator $\mathscr{A}$ is demicontinuous (so it is also hemicontinuous) and, by [6, Proposition 2.4] we deduce that it is maximal monotone.

Lemma 3.2. If the assumptions (H1) and (H3) hold, then the operator $\mathscr{B}$ is maximal monotone in $X$.

Proof. The operator $\mathscr{B}$ is evidently monotone

$$
\begin{equation*}
\langle Z-\bar{Z}, U-\bar{U}\rangle_{X}=\sum_{j=1}^{N} h_{j}\left(\left\langle\gamma_{j}-\bar{\gamma}_{j}, u_{j}-\bar{u}_{j}\right\rangle+\left\langle\delta_{j}-\bar{\delta}_{j}, v_{j}-\bar{v}_{j}\right\rangle\right) \geq 0 \tag{3.10}
\end{equation*}
$$

for all $U=\left(u_{1}, u_{2}, \ldots, u_{N}, v_{1}, \ldots, v_{N}\right)^{T}, \bar{U}=\left(\bar{u}_{1}, \bar{u}_{2}, \ldots, \bar{u}_{N}, \bar{v}_{1}, \ldots, \bar{v}_{N}\right)^{T} \in D(\mathscr{B}), Z \in \mathscr{B}(U)$, $\bar{Z} \in \mathscr{B}(\bar{U})$, for all $\gamma_{j} \in A\left(u_{j}\right), \bar{\gamma}_{j} \in A\left(\bar{u}_{j}\right), \delta_{j} \in B\left(v_{j}\right), \bar{\delta}_{j} \in B\left(\bar{v}_{j}\right), j=\overline{1, N}$.

It is also maximal monotone in $X$. Indeed, by [6, Proposition 2.2] it is sufficient (and necessary) to show that for $\lambda>0, R(I+\lambda \mathscr{B})=X \Leftrightarrow$ for all $Y \in X, Y=\left(x_{1}, x_{2}, \ldots, x_{N}, y_{1}, \ldots\right.$, $\left.y_{N}\right)^{T}$ there exists $U \in X, U=\left(u_{1}, u_{2}, \ldots, u_{N}, v_{1}, \ldots, v_{N}\right)^{T}$ such that

$$
\begin{equation*}
U+\lambda \mathscr{B}(U) \ni Y . \tag{3.11}
\end{equation*}
$$

The last relation gives us

$$
\begin{array}{ll}
u_{j}+\lambda y_{j}=x_{j}, & j=\overline{1, N},  \tag{3.12}\\
v_{j}+\lambda \delta_{j}=y_{j}, & j=\overline{1, N},
\end{array} \quad \begin{aligned}
& u_{j}=(I+\lambda A)^{-1}\left(x_{j}\right)=J_{\lambda}^{A}\left(x_{j}\right), \\
& v_{j}=(I+\lambda B)^{-1}\left(y_{j}\right)=J_{\lambda}^{B}\left(y_{j}\right), \\
& j=\overline{1, N},
\end{aligned}
$$

where $\gamma_{j} \in A\left(u_{j}\right), \delta_{j} \in B\left(v_{j}\right) j=\overline{1, N}$, and $J_{\lambda}^{A}$ and $J_{\lambda}^{B}$ are the resolvents of $A$ and $B$, respectively ( $A$ and $B$ are maximal monotone). Then $U=\left(u_{1}, \ldots, u_{N}, v_{1}, \ldots, v_{N}\right)^{T}$, where $u_{j}$ and $v_{j}, j=\overline{1, N}$, defined above, satisfy our condition (3.11).

We give now the main result for our initial problem $(\bar{S})+(\overline{E C})+(\overline{I D})$.
Theorem 3.3. Assume that the assumptions (H1)-(H3) hold. If $u_{j 0} \in D(A)$, for all $j=$ $\overline{1, N}, v_{j 0} \in D(B)$, for all $j=\overline{1, N}$, and $f_{j}, g_{j} \in W^{1,1}(0, T ; H), j=\overline{1, N}$, then there exist unique functions $u_{j}$ and $v_{j} \in W^{1, \infty}(0, T ; H), j=\overline{1, N}, u_{j}(t) \in D(A), v_{j}(t) \in D(B)$, for all $j=\overline{1, N}$, for all $t \in[0, T]$, which verify the system $(\bar{S})$ for every $t \in[0, T)$, the condition $(\overline{E C})$ for every $t \in[0, T)$, and the initial data $(\overline{I D})$.

Moreover $u_{j}$ and $v_{j}, j=\overline{1, N}$, are everywhere differentiable from right in the topology of $H$ and

$$
\begin{gather*}
\frac{d^{+} u_{j}}{d t}=\left(f_{j}-A\left(u_{j}\right)-\frac{v_{j}-v_{j-1}}{h_{j}}\right)^{0}, \quad j=\overline{1, N}, \\
\frac{d^{+} v_{j}}{d t}=\left(g_{j}-B\left(v_{j}\right)-\frac{u_{j+1}-u_{j}}{h_{j}}\right)^{0}, \quad j=\overline{1, N}, \forall t \in[0, T), \tag{3.13}
\end{gather*}
$$

with $v_{0}(t)=-\alpha\left(u_{1}(t)\right), u_{N+1}(t)=\beta\left(v_{N}(t)\right), \forall t \in[0, T)$.
Proof. Because the operator $\mathscr{B}$ is maximal monotone in $X$ and $\mathscr{A}$ is single-valued, with $D(\mathscr{A})=X$, monotone, and hemicontinuous, by [3, Corollary 1.3, Chapter II] we deduce that $\mathscr{A}+\mathscr{B}: D(\mathscr{B}) \subset X \rightarrow X$ is maximal monotone. By [3, Theorem 2.2, Corollary 2.1, Chapter III] we deduce that, for $U_{0} \in D(\mathscr{B})$ and $F \in W^{1,1}(0, T ; X)$, the problem $(\bar{P})$ has a unique solution $U=\left(u_{1}, u_{2}, \ldots, u_{N}, v_{1}, \ldots, v_{N}\right)^{T} \in W^{1, \infty}(0, T ; X), U(t) \in D(\mathscr{B})$, for all $t \in[0, T)$. We consider $(\bar{P})_{1}$ in the interval $[0, T+\varepsilon], \varepsilon>0$, (by extending correspondingly the functions $f_{j}$ and $\left.g_{j}, j=\overline{1, N}\right)$ and we get $U(T) \in D(\mathscr{B})$.

The solution $U$ is everywhere differentiable from right and

$$
\begin{equation*}
\frac{d^{+} U}{d t}(t)=(F(t)-\mathscr{A}(U(t))-\mathscr{B}(U(t)))^{0}, \quad \forall t \in[0, T), \tag{3.14}
\end{equation*}
$$

that is, the relations from theorem are verified. In addition we have

$$
\begin{equation*}
\left\|\frac{d^{+} U}{d t}(t)\right\|_{X} \leq\left\|\left(F(0)-\mathscr{A}\left(U_{0}\right)-\mathscr{B}\left(U_{0}\right)\right)^{0}\right\|_{X}+\int_{0}^{t}\left\|\frac{d F}{d s}(s)\right\|_{X} d s, \quad \forall t \in[0, T) \tag{3.15}
\end{equation*}
$$

If $U$ and $V$ are the solutions of $(\bar{P})$ corresponding to $\left(U_{0}, F\right),\left(V_{0}, G\right) \in D(\mathscr{B}) \times W^{1,1}(0$, $T ; X)$, then

$$
\begin{equation*}
\|U(t)-V(t)\|_{X} \leq\left\|U_{0}-V_{0}\right\|_{X}+\int_{0}^{t}\|F(s)-G(s)\|_{X} d s, \quad \forall t \in[0, T] \tag{3.16}
\end{equation*}
$$

Remark 3.4. If $U_{0} \in \overline{D(\mathscr{P})}^{=} \overline{D(A)}^{N} \times \overline{D(B)}^{N}$ and $F \in L^{1}(0, T ; X)$, then, by [3, Corollary 2.2, Chapter III], the problem $(\bar{P}) \Leftrightarrow(\bar{S})+(\overline{E C})+(\overline{I D})$ has a unique weak solution $U \in$ $C([0, T] ; X)$, that is, there exist $\left(F_{n}\right)_{n} \subset W^{1,1}(0, T ; X), F_{n} \rightarrow F$, as $n \rightarrow \infty$, in $L^{1}(0, T ; X)$ and $\left(U_{n}\right)_{n} \subset W^{1, \infty}(0, T ; X), U_{n}(0)=U_{0}, U_{n} \rightarrow U$, as $n \rightarrow \infty$ in $C([0, T] ; X)$, strong solutions for the problems

$$
\begin{equation*}
\frac{d U_{n}}{d t}(t)+(\mathscr{A}+\mathscr{B})\left(U_{n}(t)\right) \ni F_{n}(t), \quad \text { for a.a. } t \in(0, T), n=1,2, \ldots \tag{3.17}
\end{equation*}
$$

## 4. The problem $(\widetilde{S})+(\widetilde{E C})+(\widetilde{I D})$

We present the assumptions that we will use in this section as follows.
$(\widetilde{\mathrm{H}} 1)$ The operators $A: D(A) \subset H \rightarrow H$ and $B: D(B) \subset H \rightarrow H$ are maximal monotone, $0 \in A(0), 0 \in B(0)$, and there exist $a_{1}, a_{2}>0$ such that

$$
\begin{equation*}
\|\gamma\| \leq a_{1}\|u\|, \quad \forall u \in D(A), \forall \gamma \in A(u) ; \quad\|\delta\| \leq a_{2}\|u\|, \quad \forall u \in D(B), \forall \delta \in B(u) . \tag{4.1}
\end{equation*}
$$

( $\widetilde{\mathrm{H} 2)}$ The operator $\alpha: H \rightarrow H$ is single-valued and maximal monotone.
$(\widetilde{\mathrm{H}} 3)$ The constant $h>0$.
We consider the space $Y=l_{h}^{2}(H) \times l_{h}^{2}(H)$, where $l_{h}^{2}(H)=\left\{\left(u_{n}\right)_{n} \subset H ; \sum_{n=1}^{\infty}\left\|u_{n}\right\|^{2}<\infty\right\}$ $\left(=l^{2}(H)\right)$, with the scalar product

$$
\begin{align*}
\left\langle\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right),\left(\left(\bar{u}_{n}\right)_{n},\left(\bar{v}_{n}\right)_{n}\right)\right\rangle_{Y} & =\left\langle\left(u_{n}\right)_{n},\left(\bar{u}_{n}\right)_{n}\right\rangle_{\sum_{n}(H)}+\left\langle\left(v_{n}\right)_{n},\left(\bar{v}_{n}\right)_{n}\right\rangle_{l_{n}^{2}(H)} \\
& =\sum_{n=1}^{\infty} h\left\langle u_{n}, \bar{u}_{n}\right\rangle+\sum_{n=1}^{\infty} h\left\langle v_{n}, \bar{v}_{n}\right\rangle . \tag{4.2}
\end{align*}
$$

We define the operator $\tilde{\mathscr{A}}: Y \rightarrow Y$,

$$
\begin{equation*}
\tilde{\mathscr{A}}\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)=\left(\left(\frac{v_{n}-v_{n-1}}{h}\right)_{n},\left(\frac{u_{n+1}-u_{n}}{h}\right)_{n}\right), \quad \text { with } v_{0}=-\alpha\left(u_{1}\right), \tag{4.3}
\end{equation*}
$$

and the operator $\widetilde{\mathscr{B}}: D(\widetilde{\mathscr{M}}) \subset Y \rightarrow Y$,

$$
\begin{equation*}
\widetilde{\mathscr{B}}\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)=\left\{\left(\left(y_{n}\right)_{n},\left(\delta_{n}\right)_{n}\right) \in Y, \gamma_{n} \in A\left(u_{n}\right), \delta_{n} \in B\left(v_{n}\right), \forall n \geq 1\right\}, \tag{4.4}
\end{equation*}
$$

with $D(\widetilde{\mathscr{B}})=\left\{\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in Y ; u_{n} \in D(A), v_{n} \in D(B), \forall n \geq 1\right\}$.

Lemma 4.1. If the assumptions $(\widetilde{H 2})$ and $(\widetilde{H 3})$ hold, then the operator $\tilde{\mathscr{A}}$ is monotone and demicontinuous in $Y$.

Proof. First we observe that $\tilde{\mathscr{A}}$ is well-defined in $Y$. If $\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in Y$, then $\tilde{\mathcal{A}}\left(\left(u_{n}\right)_{n}\right.$, $\left.\left(v_{n}\right)_{n}\right) \in Y$, and $D(\tilde{\mathscr{A}})=Y$.

The operator $\tilde{\mathscr{A}}$ is monotone, because

$$
\begin{align*}
& \left\langle\tilde{\mathscr{A}}\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)-\tilde{\mathscr{A}}\left(\left(\bar{u}_{n}\right)_{n},\left(\bar{v}_{n}\right)_{n}\right),\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)-\left(\left(\bar{u}_{n}\right)_{n},\left(\bar{v}_{n}\right)_{n}\right)\right\rangle_{Y} \\
& =  \tag{4.5}\\
& =\left\langle\left(\frac{v_{n}-v_{n-1}}{h}\right)_{n}-\left(\frac{\bar{v}_{n}-\bar{v}_{n-1}}{h}\right)_{n},\left(u_{n}-\bar{u}_{n}\right)_{n}\right\rangle_{l_{n}^{2}(H)} \\
& \quad+\left\langle\left(\frac{u_{n+1}-u_{n}}{h}\right)_{n}-\left(\frac{\bar{u}_{n+1}-\bar{u}_{n}}{h}\right)_{n},\left(v_{n}-\bar{v}_{n}\right)_{n}\right\rangle_{\sum_{n}(H)} \\
& =\left\langle\alpha\left(u_{1}\right)-\alpha\left(\bar{u}_{1}\right), u_{1}-\bar{u}_{1}\right\rangle \geq 0 .
\end{align*}
$$

Next we prove that $\tilde{\mathscr{A}}$ is demicontinuous, that is, if

$$
\begin{align*}
\quad\left(\left(u_{n}^{j}\right)_{n},\left(v_{n}^{j}\right)_{n}\right) \longrightarrow\left(\left(u_{n}^{0}\right)_{n},\left(v_{n}^{0}\right)_{n}\right), & \text { for } j \longrightarrow \infty \text { in } Y,  \tag{4.6}\\
\tilde{\mathcal{A}}\left(\left(u_{n}^{j}\right)_{n},\left(v_{n}^{j}\right)_{n}\right) \longrightarrow\left(\left(x_{n}\right)_{n},\left(y_{n}\right)_{n}\right), & \text { for } j \longrightarrow \infty \text { in } Y, \tag{4.7}
\end{align*}
$$

then $\left(\left(x_{n}\right)_{n},\left(y_{n}\right)_{n}\right)=\tilde{\mathscr{A}}\left(\left(u_{n}^{0}\right)_{n},\left(v_{n}^{0}\right)_{n}\right)$.
From (4.6) we deduce

$$
\begin{align*}
& \sqrt{h\left\|\left(u_{n}^{j}\right)_{n}-\left(u_{n}^{0}\right)_{n}\right\|_{\mathcal{l}^{2}(H)}^{2}+h\left\|\left(v_{n}^{j}\right)_{n}-\left(v_{n}^{0}\right)_{n}\right\|_{\mathcal{l}^{2}(H)}^{2}} \longrightarrow 0, \quad \text { for } j \longrightarrow \infty \Longrightarrow \\
& \left\|\left(u_{n}^{j}\right)_{n}-\left(u_{n}^{0}\right)_{n}\right\|_{2^{2}(H)} \longrightarrow 0, \quad \text { for } j \longrightarrow \infty \\
& \left\|\left(v_{n}^{j}\right)_{n}-\left(v_{n}^{0}\right)_{n}\right\|_{p^{2}(H)} \longrightarrow 0, \quad \text { for } j \longrightarrow \infty  \tag{4.8}\\
& \sum_{n=1}^{\infty}\left\|u_{n}^{j}-u_{n}^{0}\right\|^{2} \longrightarrow 0, \quad \text { for } j \longrightarrow \infty \quad u_{n}^{j} \longrightarrow u_{n}^{0}, \quad \text { for } j \longrightarrow \infty, \forall n, \\
& \sum_{n=1}^{\infty}\left\|v_{n}^{j}-v_{n}^{0}\right\|^{2} \longrightarrow 0, \quad \text { for } j \longrightarrow \infty \quad v_{n}^{j} \longrightarrow v_{n}^{0}, \quad \text { for } j \longrightarrow \infty, \forall n \text {. }
\end{align*}
$$

Then by (4.7) we have

$$
\begin{aligned}
& \left\langle\tilde{A}\left(\left(u_{n}^{j}\right)_{n},\left(v_{n}^{j}\right)_{n}\right),\left(\left(\alpha_{n}\right)_{n},\left(\beta_{n}\right)_{n}\right)\right\rangle_{Y} \\
& \quad \longrightarrow\left\langle\left(\left(x_{n}\right)_{n},\left(y_{n}\right)_{n}\right),\left(\left(\alpha_{n}\right)_{n},\left(\beta_{n}\right)_{n}\right)\right\rangle_{Y}, \quad \text { as } j \longrightarrow \infty, \forall\left(\left(\alpha_{n}\right)_{n},\left(\beta_{n}\right)_{n}\right) \in Y, \\
& \quad \Longrightarrow\left\langle\left(\left(\frac{v_{n}^{j}-v_{n-1}^{j}}{h}\right)_{n},\left(\frac{u_{n+1}^{j}-u_{n}^{j}}{h}\right)_{n}\right),\left(\left(\alpha_{n}\right)_{n},\left(\beta_{n}\right)_{n}\right)\right\rangle_{Y},
\end{aligned}
$$

$$
\begin{align*}
& \longrightarrow \sum_{n=1}^{\infty} h\left\langle x_{n}, \alpha_{n}\right\rangle+\sum_{n=1}^{\infty} h\left\langle y_{n}, \beta_{n}\right\rangle, \quad \text { as } j \longrightarrow \infty, \text { with } v_{0}^{j}=-\alpha\left(u_{1}^{j}\right), \forall j \geq 1, \\
& \Longrightarrow \sum_{n=1}^{\infty}\left\langle v_{n}^{j}-v_{n-1}^{j}, \alpha_{n}\right\rangle+\sum_{n=1}^{\infty}\left\langle u_{n+1}^{j}-u_{n}^{j}, \beta_{n}\right\rangle \\
& \longrightarrow \sum_{n=1}^{\infty} h\left\langle x_{n}, \alpha_{n}\right\rangle+\sum_{n=1}^{\infty} h\left\langle y_{n}, \beta_{n}\right\rangle, \quad \text { as } j \longrightarrow \infty . \tag{4.9}
\end{align*}
$$

We take $\alpha_{n}=0$, for all $n \geq 1$, and $\left(\beta_{n}\right)_{n}=(x, 0,0, \ldots),(0, x, 0, \ldots), \ldots(x \in H)$; we obtain by (4.8) $y_{n}=\left(u_{n+1}^{0}-u_{n}^{0}\right) / h$, for all $n \geq 1$. For $\beta_{n}=0$, for all $n \geq 1$ and $\left(\alpha_{n}\right)_{n}=(0, x, 0, \ldots)$, $(0,0, x, \ldots), \ldots,(x \in H)$ we obtain by (4.8) that $x_{n}=\left(v_{n}^{0}-v_{n-1}^{0}\right) / h, n \geq 2$. For $\beta_{n}=0$, for all $n \geq 1$ and $\alpha_{n}=(x, 0,0, \ldots)$ we find $\left(v_{1}^{j}+\alpha\left(u_{1}^{j}\right)\right) / h-x_{1}$, so

$$
\begin{equation*}
\alpha\left(u_{1}^{j}\right)=v_{1}^{j}+\alpha\left(u_{1}^{j}\right)-v_{1}^{j} \longrightarrow h x_{1}-v_{1}^{0}, \quad \text { as } j \longrightarrow \infty \tag{4.10}
\end{equation*}
$$

( $v_{1}^{j} \rightarrow v_{1}^{0}$ as $j \rightarrow \infty$, by (4.8) with $n=1$ ). Now since $\alpha$ is a demicontinuous operator, and moreover $u_{1}^{j} \rightarrow u_{1}^{0}$, as $j \rightarrow \infty$ (by (4.8) with $n=1$ ), we have

$$
\begin{equation*}
h x_{1}-v_{1}^{0}=\alpha\left(u_{1}^{0}\right) \Longleftrightarrow x_{1}=\frac{v_{1}^{0}+\alpha\left(u_{1}^{0}\right)}{h} \tag{4.11}
\end{equation*}
$$

Therefore $\left(\left(\left(v_{n}^{0}-v_{n-1}^{0}\right) / h\right)_{n},\left(\left(u_{n+1}^{0}-u_{n}^{0}\right) / h\right)_{n}\right)=\left(\left(x_{n}\right)_{n},\left(y_{n}\right)_{n}\right),\left(v_{0}^{0}=-\alpha\left(u_{1}^{0}\right)\right)$. We deduce that $\tilde{\mathscr{A}}$ is demicontinuous, so it is maximal monotone.
Lemma 4.2. If the assumptions $(\widetilde{H 1})$ and $(\widetilde{H 3})$ hold, then the operator $\widetilde{\mathscr{B}}$ is maximal monotone in $Y$.

Proof. We suppose without loss of generality (for an easy writing) that $A$ and $B$ are singlevalued. The operator $\widetilde{\mathscr{B}}$ under the assumptions of this lemma is well-defined in $Y$. Indeed, for $\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in D(\widetilde{\mathscr{B}}) \Leftrightarrow\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in Y, u_{n} \in D(A), v_{n} \in D(B)$, for all $n \geq 1$, we have $\widetilde{\mathscr{B}}\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in Y$, that is, $\left(A\left(u_{n}\right)\right)_{n},\left(B\left(v_{n}\right)\right)_{n} \in l^{2}(H)$.

By ( $\widetilde{\mathrm{H} 1}$ ) we have

$$
\begin{align*}
& \sum_{n=1}^{\infty}\left\|A\left(u_{n}\right)\right\|^{2} \leq \sum_{n=1}^{\infty} a_{1}^{2}\left\|u_{n}\right\|^{2}=a_{1}^{2}\left\|\left(u_{n}\right)_{n}\right\|_{1^{2}(H)}^{2}<\infty  \tag{4.12}\\
& \sum_{n=1}^{\infty}\left\|B\left(v_{n}\right)\right\|^{2} \leq \sum_{n=1}^{\infty} a_{2}^{2}\left\|v_{n}\right\|^{2}=a_{2}^{2}\left\|\left(v_{n}\right)_{n}\right\|_{l^{2}(H)}^{2}<\infty
\end{align*}
$$

The operator $\widetilde{\mathscr{B}}$ is monotone

$$
\begin{align*}
& \left\langle\widetilde{\mathscr{P}}\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)-\widetilde{\mathscr{P}}\left(\left(\bar{u}_{n}\right)_{n},\left(\bar{v}_{n}\right)_{n}\right),\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)-\left(\left(\bar{u}_{n}\right)_{n},\left(\bar{v}_{n}\right)_{n}\right)\right\rangle_{Y} \\
& =\left\langle\left(\left(A\left(u_{n}\right)\right)_{n},\left(B\left(v_{n}\right)\right)_{n}\right)-\left(\left(A\left(\bar{u}_{n}\right)\right)_{n},\left(B\left(\bar{v}_{n}\right)\right)_{n}\right),\left(\left(u_{n}-\bar{u}_{n}\right)_{n},\left(v_{n}-\bar{v}_{n}\right)_{n}\right)\right\rangle_{Y} \\
& =\left\langle\left(A\left(u_{n}\right)-A\left(\bar{u}_{n}\right)\right)_{n},\left(u_{n}-\bar{u}_{n}\right)_{n}\right\rangle_{l_{n}(H)}+\left\langle\left(B\left(v_{n}\right)-B\left(\bar{v}_{n}\right)\right)_{n},\left(v_{n}-\bar{v}_{n}\right)_{n}\right\rangle_{l_{n}^{2}(H)} \\
& =\sum_{n=1}^{\infty} h\left\langle A\left(u_{n}\right)-A\left(\bar{u}_{n}\right), u_{n}-\bar{u}_{n}\right\rangle+\sum_{n=1}^{\infty} h\left\langle B\left(v_{n}\right)-B\left(\bar{v}_{n}\right), v_{n}-\bar{v}_{n}\right\rangle \geq 0, \\
& \forall\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right),\left(\left(\bar{u}_{n}\right)_{n},\left(\bar{v}_{n}\right)_{n}\right) \in D(\widetilde{\mathscr{B}) .} \tag{4.13}
\end{align*}
$$

Moreover $\widetilde{\mathscr{B}}$ is maximal monotone, that is,

$$
\begin{equation*}
\forall \lambda>0, \quad R(I+\lambda \widetilde{B})=Y \Longleftrightarrow \forall Z=\left(\left(x_{n}\right)_{n},\left(y_{n}\right)_{n}\right) \in Y, \quad \exists W=\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in D(\widetilde{\mathscr{P}}) \tag{4.14}
\end{equation*}
$$

such that $W+\lambda \widetilde{\mathscr{B}}(W)=Z$. The last relation is equivalent to

$$
\begin{gather*}
\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)+\lambda\left(\left(A\left(u_{n}\right)\right)_{n},\left(B\left(v_{n}\right)\right)_{n}\right)=\left(\left(x_{n}\right)_{n},\left(y_{n}\right)_{n}\right) \Longleftrightarrow \\
\left(u_{n}\right)_{n}+\lambda\left(A\left(u_{n}\right)\right)_{n}=\left(x_{n}\right)_{n} \quad u_{n}+\lambda A\left(u_{n}\right)=x_{n}, \\
\left(v_{n}\right)_{n}+\lambda\left(B\left(v_{n}\right)\right)_{n}=\left(y_{n}\right)_{n} \Longrightarrow v_{n}+\lambda B\left(v_{n}\right)=y_{n}, \quad \forall n \geq 1  \tag{4.15}\\
u_{n}=(I+\lambda A)^{-1}\left(x_{n}\right)=J_{\lambda}^{A}\left(x_{n}\right), \quad v_{n}=(I+\lambda B)^{-1}\left(y_{n}\right)=J_{\lambda}^{B}\left(y_{n}\right), \quad \forall n \geq 1 .
\end{gather*}
$$

Because $A(0)=0$ we have $J_{\mu}^{A}(0)=0$, for all $\mu>0$ and

$$
\begin{equation*}
\left\|J_{\mu}^{A}(x)-J_{\mu}^{A}(0)\right\| \leq\|x\| \Longrightarrow\left\|J_{\mu}^{A}(x)\right\| \leq\|x\|, \quad \forall x \in H, \forall \mu>0 \tag{4.16}
\end{equation*}
$$

Similarly by $B(0)=0$ we deduce $J_{\mu}^{B}(0)=0$, for all $\mu>0$, and $\left\|J_{\mu}^{B} x\right\| \leq\|x\|$, for all $x \in H$, for all $\mu>0$.

With this remark we have

$$
\begin{equation*}
\sum_{n=1}^{\infty}\left\|J_{\lambda}^{A}\left(x_{n}\right)\right\|^{2} \leq \sum_{n=1}^{\infty}\left\|x_{n}\right\|^{2}<\infty, \quad \sum_{n=1}^{\infty}\left\|J_{\lambda}^{B}\left(y_{n}\right)\right\|^{2} \leq \sum_{n=1}^{\infty}\left\|y_{n}\right\|^{2}<\infty, \tag{4.17}
\end{equation*}
$$

so $W=\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in \underset{\sim}{D}(\widetilde{\mathscr{B}})$.
Using the operators $\tilde{\mathscr{A}}$ and $\widetilde{\mathscr{S}}$, the problem $(\widetilde{S})+(\widetilde{E C})+(\widetilde{I D})$ can be written as

$$
\begin{align*}
& \frac{d V}{d t}(t)+\tilde{\mathscr{A}}(V(t))+\widetilde{\mathscr{B}}(V(t)) \ni \widetilde{F}(t), \quad t \in(0, T), \text { in } Y  \tag{P}\\
& V(0)=V_{0},
\end{align*}
$$

where $V=\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right), V_{0}=\left(\left(u_{n 0}\right)_{n},\left(v_{n 0}\right)_{n}\right)$, and $\widetilde{F}=\left(\left(f_{n}\right)_{n},\left(g_{n}\right)_{n}\right)$.

Theorem 4.3. Assume that the assumptions $(\widetilde{H 1})-(\widetilde{H 3})$ hold. If $V_{0} \in D(\widetilde{\mathscr{P}})\left(u_{n 0} \in D(A)\right.$, $v_{n 0} \in D(B)$, for all $n \geq 1$ with $\left.\left(u_{n 0}\right)_{n},\left(v_{n 0}\right)_{n} \in l^{2}(H)\right)$ and $\tilde{F} \in W^{1,1}(0, T ; Y)\left(\left(f_{n}\right)_{n},\left(g_{n}\right)_{n} \in\right.$ $\left.W^{1,1}\left(0, T ; l^{2}(H)\right)\right)$, then there exists a unique function $V=\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in W^{1, \infty}(0, T ; Y)$, with $V(t) \in D(\widetilde{B})$, for all $t \in[0, T]$, and $V$ verifies the system $(\widetilde{S})$, for all $t \in[0, T)$, the extreme condition $(\widetilde{E C})$, for all $t \in[0, T)$, and the initial data $(\widetilde{I D})$.
Proof. By Lemmas 4.1 and 4.2 we have $D(\tilde{\mathscr{A}}+\widetilde{\mathscr{B}})=D(\widetilde{\mathscr{B}})$ and, by [3, Corollary 1.3, Chapter II], $\tilde{\mathscr{A}}+\widetilde{\mathscr{B}}$ is maximal monotone. Using again [3, Theorem 2.2, Chapter III] we obtain the conclusion of the theorem. In addition $u_{n}$ and $v_{n}$ are everywhere differentiable from the right on $[0, T)$ and, by extended $f_{n}$ and $g_{n}$ on $[0, T+\varepsilon]$ with $\varepsilon>0$, we have $V(t) \in D(\widetilde{\mathscr{O}})$, for all $t \in[0, T]$.

Remark 4.4. Although the operators $\mathscr{A}$ and $\tilde{\mathscr{A}}$ have semblable forms, we cannot establish connections between them, because the spaces, where these operators are defined, are different. Indeed, defining $u_{n}=v_{n}=0$, for all $n \geq N+1$, we have

$$
\begin{equation*}
\tilde{\mathscr{A}}\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right)=\left(\frac{v_{1}-v_{0}}{h}, \ldots, \frac{v_{N}-v_{N-1}}{h},-\frac{v_{N}}{h}, \frac{u_{2}-u_{1}}{h}, \ldots, \frac{u_{N}-u_{N-1}}{h},-\frac{u_{N}}{h}\right) . \tag{4.18}
\end{equation*}
$$

Therefore $\tilde{\mathscr{A}}\left(\left(u_{n}\right)_{n},\left(v_{n}\right)_{n}\right) \in H^{N+1} \times H^{N} \neq X$. Thus, Theorem 3.3 is not a consequence of Theorem 4.3.

## Acknowledgment

The author would like to thank the referees for the careful reading of the manuscript and for their comments which led to this revised version.
