Abstract

A Newton-Kantorovich convergence theorem of a new modified Halley's method family is established in a Banach space to solve nonlinear operator equations. We also present the main results to reveal the competence of our method. Finally, two numerical examples arising in the theory of the radiative transfer, neutron transport and in the kinetic theory of gasses are provided to show the application of our theorem.

Introduction

In the last two centuries, remarkable contributions have been made to both the theory and application of nonlinear equations. Suppose that we have to find a solution of the nonlinear equation

$$F(x) = 0, \quad (1)$$

where F is defined on an open convex subset Ω of a Banach space X with values in a Banach space Y .

These equations are increasingly used to model problems in engineering applications, such as material science, electrical engineering, civil engineering, chemical engineering, mechanics and numerical optimization. There are several iterative methods [1–6] used to find a solution of nonlinear equations. One of those iterative methods is the famous Newton's method

$$x_{n+1} = x_n - F'(x_n)^{-1}F(x_n) \quad (n \geq 0) \quad (x_0 \in \Omega) \quad (2)$$

often used to solve the nonlinear operator equation under the reasonable hypotheses. However, Newton's method is only the second-order convergence. Kantorovich presented the famous convergence result [7], and afterward, many Newton-Kantorovich-type convergence theorems have been attained [8–17]. Furthermore, many deformed methods [18–22] have been presented to improve the convergence order. The famous Halley's method, which has been widely discussed [23–30], is the third-order convergence. The famous Halley's method is defined as

$$x_{n+1} = x_n - \left[I + \frac{1}{2}L_F(x_n)\left(I - \frac{1}{2}L_F(x_n) \right)^{-1} \right] F'(x_n)^{-1}F(x_n), \quad n = 0, 1, \dots,$$

where

$$L_F(x) = F'(x)^{-1}F''(x)F'(x)^{-1}F(x), \quad x \in \Omega.$$

Now, we consider Halley's method with a parameter λ in the form

$$x_{\lambda,n+1} = x_{\lambda,n} - \left[I + \frac{1}{2}L_F(x_{\lambda,n})(I - \lambda L_F(x_{\lambda,n}))^{-1} \right] F'(x_{\lambda,n})^{-1}F(x_{\lambda,n}), \quad n = 0, 1, \dots$$

One can see that Halley's method and super-Halley's method are the special cases for $\lambda = \frac{1}{2}$ and $\lambda = 1$. In this method, in every step, one needs to compute the second order derivatives of the function F . The computing cost will be the high. To avoid the computation of $F''(x_n)$, and to maintain the high order convergence, many researchers have replaced the second order derivative with the first order divided differences. They presented the modified Halley's methods with the parameters p, λ . Their modified Halley's method is as follows [12]:

$$\begin{cases} y_n = x_n - F'(x_n)^{-1}F(x_n), \\ H(x_n, y_n) = \frac{1}{p}F'(x_n)^{-1}[F'(x_n + p(y_n - x_n)) - F'(x_n)], \quad \lambda \in [0, 1], p \in (0, 1], \\ x_{n+1} = y_n - \frac{1}{2}H(x_n, y_n)[I - \lambda H(x_n, y_n)](y_n - x_n). \end{cases} \quad (3)$$

For $p = \frac{1}{2}, \lambda = 0$, the method becomes Chebyshev's iterative method (see [13]). For $p = \frac{2}{3}, \lambda = 1$, the method becomes inverse-free Jarratt iterative method (see [14, 15]). In this paper, we establish a Kantorovich-type third-order convergence theorem for this kind of method by using majorizing function to improve the result [12].

1 Main results

In this section, we establish a Newton-Kantorovich convergence theorem via majorizing function. Let $g(t) = \frac{1}{6}Kt^3 + \frac{1}{2}\gamma t^2 - t + \eta$, where K, γ, η are positive real numbers. Denote

$$\alpha = \frac{2}{\gamma + \sqrt{\gamma^2 + 2K}}, \quad \beta = \alpha - \frac{1}{6}K\alpha^3 - \frac{1}{2}\gamma\alpha^2 = \frac{2(\gamma + 2\sqrt{\gamma^2 + 2K})}{3(\gamma + \sqrt{\gamma^2 + 2K})^2}.$$

Theorem 1 Suppose that X and Y are the Banach spaces, and Ω is an open convex subset of X , $F : \Omega \subset X \rightarrow Y$ has the second order Fréchet derivative, $F'(x_0)^{-1}$ exists for $x_0 \in \Omega$, and the following conditions hold:

$$\begin{aligned} \|F'(x_0)^{-1}F(x_0)\| &\leq \eta, \quad \|F'(x_0)^{-1}F''(x_0)\| \leq \gamma, \\ \|F'(x_0)^{-1}(F''(x) - F''(y))\| &\leq N\|x - y\|, \quad x, y \in \Omega, \\ \frac{2+3p}{2-3p}N &\leq K, \quad \eta < \beta, \\ \overline{S(x_0, r_1)} &\subset \Omega, \end{aligned} \quad (4)$$

where $r_1 \leq r_2$ are two positive real roots of the function $g(t)$. Then, for $0 < p < \frac{2}{3}$, the sequence $\{x_n\}_{n \geq 0}$ generated by (3) is well defined, $x_n \in \overline{S(x_0, r_1)}$ and converges to the unique solution x^* of equation (1) in $S(x_0, \alpha)$.

Theorem 2 Suppose that X and Y are the Banach spaces, and Ω is an open convex subset of X , $F : \Omega \subset X \rightarrow Y$ has the third-order Fréchet derivative, $F'(x_0)^{-1}$ exists for $x_0 \in \Omega$, and the following conditions hold:

$$\begin{aligned} & \|F'(x_0)^{-1}F(x_0)\| \leq \eta, \quad \|F'(x_0)^{-1}F''(x_0)\| \leq \gamma, \quad \|F'(x_0)^{-1}F'''(x)\| \leq N, \\ & \|F'(x_0)^{-1}(F'''(x) - F'''(y))\| \leq L\|x - y\|, \quad x, y \in \Omega, \\ & \frac{(1+2p^2)L}{6\gamma(1-p)} + N \leq K, \quad \eta < \beta, \\ & \overline{S(x_0, r_1)} \subset \Omega. \end{aligned} \tag{5}$$

Then for $0 < p \leq \frac{2}{3}$, the sequence $\{x_n\}_{n \geq 0}$ generated by (3) is well defined, $x_n \in \overline{S(x_0, r_1)}$ and converges to the unique solution x^* of equation (1) in $S(x_0, \alpha)$.

To prove Theorems 1 and 2, we first give some lemmas.

Lemma 1 If $\eta \leq \beta$, the polynomial $g(t)$ has two positive real roots r_1, r_2 (let $0 < r_1 < r_2 < +\infty$), and a negative real root $-r_0$ ($r_0 > 0$).

Proof From definition of the function $g(t)$, there follows that $g(0) = \eta > 0$, $\lim_{t \rightarrow -\infty} g(t) = -\infty$, hence $g(t)$ has a negative root. Denote it $-r_0$. We get that $g'(t) = \frac{1}{2}Kt^2 + \gamma t - 1$ has the unique positive root $\alpha = \frac{2}{\gamma + \sqrt{\gamma^2 + 2K}}$, and for $t \geq 0$, $g''(t) = Kt + \gamma > 0$. So, the necessary and sufficient condition that $g(t)$ has two positive roots for $t \geq 0$ is that the minimum of $g(t)$ satisfies $g(\alpha) \leq 0$, that is also $\eta \leq \beta$. This completes the proof of Lemma 1. \square

Lemma 2 (see [12]) Suppose that the sequences $\{t_n\}_{n \geq 0}$ and $\{s_n\}_{n \geq 0}$ are generated by the following iteration $t_0 = 0$,

$$\begin{cases} s_n = t_n - g'(t_n)^{-1}g(t_n), \\ H_g(t_n, s_n) = \frac{1}{p}g'(t_n)^{-1}[g'(t_n + p(s_n - t_n)) - g'(t_n)], \\ t_{n+1} = s_n - \frac{1}{2}H_g(t_n, s_n)[I - \lambda H_g(t_n, s_n)](s_n - t_n). \end{cases} \tag{6}$$

Then for $\eta \leq \beta$, $\{t_n\}, \{s_n\}$ are increasing and converge to r_1 .

Lemma 3 Suppose that $F(x)$ satisfies conditions (4) of Theorem 1, $\forall x \in B(x_0, r_1)$, $F'(x)^{-1}$ exists and satisfies the following inequalities:

$$(I) \quad \|F'(x)^{-1}F'(x_0)\| \leq -g'(\|x - x_0\|)^{-1},$$

$$(II) \quad \|F'(x_0)^{-1}F''(x)\| \leq g''(\|x - x_0\|).$$

Proof

$$\begin{aligned} \|F'(x_0)^{-1}F''(x)\| &= \|F'(x_0)^{-1}F''(x_0) + F'(x_0)^{-1}[F''(x) - F''(x_0)]\| \\ &\leq \gamma + N\|x - x_0\| \leq \gamma + K\|x - x_0\| = g''(\|x - x_0\|). \end{aligned}$$

By the proof process of Lemma 1, we get $g'(t) < 0$, $t \in [0, r_1]$. Hence, for $x \in B(x_0, r_1)$,

$$\begin{aligned} & \|F'(x_0)^{-1}F'(x) - I\| \\ &= \|F'(x_0)^{-1}[F'(x) - F'(x_0) - F''(x_0)(x - x_0) + F''(x_0)(x - x_0)]\| \\ &\leq \left\| \int_0^1 F'(x_0)^{-1}[F''(x_0 + t(x - x_0)) - F''(x_0)] dt(x - x_0) \right\| + \gamma \|x - x_0\| \\ &\leq \int_0^1 Nt dt \|x - x_0\|^2 + \gamma \|x - x_0\| \leq \frac{1}{2}K\|x - x_0\|^2 + \gamma \|x - x_0\| \\ &= 1 + g'(\|x - x_0\|) < 1. \end{aligned}$$

By the Banach theorem, we know $(F'(x_0)^{-1}F'(x))^{-1} = F'(x)^{-1}F'(x_0)$ exists, and

$$\|F'(x)^{-1}F'(x_0)\| \leq \frac{1}{1 - \|I - F'(x_0)^{-1}F'(x)\|} \leq -g'(\|x - x_0\|)^{-1}.$$

This completes the proof of Lemma 3. \square

Lemma 4 Suppose that the nonlinear operator $F : \Omega \subset X \rightarrow Y$ is defined on an open convex subset Ω of a Banach space X with values in a Banach space Y , F has the second-order Frechét derivative, and the sequences $\{x_n\}$, $\{y_n\}$ are generated by (3). Then the following formula holds for all natural numbers n :

$$\begin{aligned} F(x_{n+1}) &= \int_0^1 F''(y_n + t(x_{n+1} - y_n))(1-t) dt(x_{n+1} - y_n)^2 \\ &\quad + \int_0^1 \left[F''(x_n + t(y_n - x_n))(1-t) - \frac{1}{2}F''(x_n + pt(y_n - x_n)) \right] dt(y_n - x_n)^2 \\ &\quad - \frac{1-\lambda}{2} \int_0^1 F''(x_n + pt(y_n - x_n)) dt(y_n - x_n) H(x_n, y_n)(y_n - x_n) \\ &\quad - \frac{1}{2} \int_0^1 [F''(x_n + t(y_n - x_n)) - F''(x_n + pt(y_n - x_n))] dt(y_n - x_n) \\ &\quad \times H(x_n, y_n)(y_n - x_n) \\ &\quad + \frac{\lambda}{2} \int_0^1 F''(x_n + t(y_n - x_n)) dt(y_n - x_n) H(x_n, y_n) H(x_n, y_n)(y_n - x_n). \end{aligned}$$

Proof

$$\begin{aligned} F(x_{n+1}) &= F(x_{n+1}) - F(y_n) - F'(y_n)(x_{n+1} - y_n) + F(y_n) + F'(y_n)(x_{n+1} - y_n) \\ &= \int_0^1 F''(y_n + t(x_{n+1} - y_n))(1-t) dt(x_{n+1} - y_n)^2 + F(y_n) + F(y'_n)(x_{n+1} - y_n), \\ F'(x_n)H(x_n, y_n) &= \frac{1}{p}[F'(x_n + p(y_n - x_n)) - F'(x_n)] = \int_0^1 F''(x_n + pt(y_n - x_n)) dt(y_n - x_n), \\ F(y_n) + F(y'_n)(x_{n+1} - y_n) &= F(y_n) - F(x_n) - F'(x_n)(y_n - x_n)^2 - \frac{1}{2}F'(y_n)H(x_n, y_n)[I - \lambda H(x_n, y_n)](y_n - x_n) \end{aligned}$$

$$\begin{aligned}
 &= \int_0^1 F''(x_n + t(y_n - x_n))(1-t) dt (y_n - x_n)^2 \\
 &\quad - \frac{1}{2} [F'(y_n) - F'(x_n)] H(x_n, y_n) [I - \lambda H(x_n, y_n)] (y_n - x_n) \\
 &\quad - \frac{1}{2} F'(x_n) H(x_n, y_n) [I - \lambda H(x_n, y_n)] (y_n - x_n) \\
 &= \int_0^1 F''(x_n + t(y_n - x_n))(1-t) dt (y_n - x_n)^2 - \frac{1}{2} \int_0^1 F''(x_n + pt(y_n - x_n)) dt (y_n - x_n)^2 \\
 &\quad + \frac{\lambda}{2} \int_0^1 F''(x_n + pt(y_n - x_n)) dt (y_n - x_n) H(x_n, y_n) (y_n - x_n) \\
 &\quad - \frac{1}{2} \int_0^1 F''(x_n + t(y_n - x_n)) dt (y_n - x_n) H(x_n, y_n) (y_n - x_n) \\
 &\quad + \frac{\lambda}{2} \int_0^1 F''(x_n + t(y_n - x_n)) dt (y_n - x_n) H(x_n, y_n) H(x_n, y_n) (y_n - x_n).
 \end{aligned}$$

Hence,

$$\begin{aligned}
 F(x_{n+1}) &= \int_0^1 F''(y_n + t(x_{n+1} - y_n))(1-t) dt (x_{n+1} - y_n)^2 \\
 &\quad + \int_0^1 \left[F''(x_n + t(y_n - x_n))(1-t) - \frac{1}{2} F''(x_n + pt(y_n - x_n)) \right] dt (y_n - x_n)^2 \\
 &\quad - \frac{1-\lambda}{2} \int_0^1 F''(x_n + pt(y_n - x_n)) dt (y_n - x_n) H(x_n, y_n) (y_n - x_n) \\
 &\quad - \frac{1}{2} \int_0^1 [F''(x_n + t(y_n - x_n)) - F''(x_n + pt(y_n - x_n))] dt (y_n - x_n) \\
 &\quad \times H(x_n, y_n) (y_n - x_n) \\
 &\quad + \frac{\lambda}{2} \int_0^1 F''(x_n + t(y_n - x_n)) dt (y_n - x_n) H(x_n, y_n) H(x_n, y_n) (y_n - x_n).
 \end{aligned}$$

This completes the proof of Lemma 4. \square

Proof of Theorem 1 By induction, we can prove, for $n \geq 0$, that the following formulae hold:

- (I_n) : $x_n \in \overline{S(x_0, t_n)}$,
- (II_n) : $\|F'(x_n)^{-1} F'(x_0)\| \leq -g'(t_n)^{-1}$, $\|F'(x_0)^{-1} F''(x_n)\| \leq g''(t_n)$,
- (III_n) : $\|y_n - x_n\| \leq s_n - t_n$,
- (IV_n) : $y_n \in \overline{S(x_0, s_n)}$,
- (V_n) : $\|x_{n+1} - y_n\| \leq t_{n+1} - s_n$.

In fact, by Lemma 2, we know that $\{t_n\}$ is increasing and converges to the minimum positive root of the function $g(t)$. Hence, $t_n < r_1$ for all natural numbers n . It is easy to verify it for the case $n = 0$. By using mathematical induction, we now suppose the formulae above also hold for $n \geq 0$. Then

$$(I_{n+1}) : \|x_{n+1} - x_0\| \leq \|x_{n+1} - y_n\| + \|y_n - x_0\| \leq t_{n+1} - s_n + s_n = t_{n+1}.$$

By Lemma 3, and the fact that $-g'(t)^{-1}, g''(t)$ are increasing on $[0, r_1]$, we get (II_{n+1}) .

$$\begin{aligned}
 (\text{III}_{n+1}) : & \left\| \int_0^1 F'(x_0)^{-1} [F''(y_n + t(x_{n+1} - y_n))(1-t) dt] (x_{n+1} - y_n)^2 \right\| \\
 & \leq \int_0^1 g''(\|y_n - x_0 + t(x_{n+1} - y_n)\|)(1-t) dt (t_{n+1} - s_n)^2 \\
 & \leq \int_0^1 g''(s_n + t(t_{n+1} - s_n))(1-t) dt (t_{n+1} - s_n)^2, \\
 & \left\| \int_0^1 F'(x_0)^{-1} \left[F''(x_n + t(y_n - x_n))(1-t) - \frac{1}{2} F''(x_n + pt(y_n - x_n)) \right] dt \right\| \\
 & \leq \left\| \int_0^1 F'(x_0)^{-1} [F''(x_n + t(y_n - x_n)) - F''(x_n)](1-t) dt \right\| \\
 & \quad + \frac{1}{2} \left\| \int_0^1 F'(x_0)^{-1} [F''(x_n + pt(y_n - x_n)) - F''(x_n)] dt \right\| \\
 & \leq \frac{(2+3p)N}{12} \|y_n - x_n\|, \\
 & \int_0^1 F'(x_0)^{-1} [F''(x_n + t(y_n - x_n)) - F''(x_n + pt(y_n - x_n))] dt \\
 & \leq \int_0^1 N(1-p)t \|y_n - x_n\| dt \leq \frac{(1-p)N}{2} (s_n - t_n), \\
 \|H(x_n, y_n)\| & = \left\| F'(x_n)^{-1} \int_0^1 F''(x_n + pt(y_n - x_n))(y_n - x_n) dt \right\| \\
 & = \left\| F'(x_n)^{-1} F'(x_0) \int_0^1 F'(x_0)^{-1} F''(x_n + pt(y_n - x_n))(y_n - x_n) dt \right\| \\
 & \leq -g'(t_n)^{-1} \int_0^1 g''(t_n + pt(s_n - t_n)) dt (s_n - t_n) = -H_g(t_n, s_n).
 \end{aligned}$$

From Lemmas 3 and 4, we get

$$\begin{aligned}
 \|F'(x_0)^{-1} F(x_{n+1})\| & \leq \int_0^1 g''(s_n + t(t_{n+1} - s_n))(1-t) dt (t_{n+1} - s_n)^2 + \frac{(2+3p)N}{12} (s_n - t_n)^3 \\
 & \quad + \frac{1-\lambda}{2} \int_0^1 g''(t_n + pt(s_n - t_n)) dt (-H_g(t_n, s_n)) (s_n - t_n)^2 \\
 & \quad + \frac{1}{2} \frac{(1-p)N}{2} (-H_g(t_n, s_n)) (s_n - t_n)^3 \\
 & \quad + \frac{\lambda}{2} \int_0^1 g''(t_n + t(s_n - t_n)) dt (s_n - t_n)^2 H_g^2(t_n, s_n) \\
 & \leq \int_0^1 g''(s_n + t(t_{n+1} - s_n))(1-t) dt (t_{n+1} - s_n)^2 \\
 & \quad + \frac{(2-3p)}{12} \cdot \frac{2+3p}{2-3p} N(s_n - t_n)^3 \\
 & \quad - \frac{1-\lambda}{2} \int_0^1 g''(t_n + pt(s_n - t_n)) dt H_g(t_n, s_n) (s_n - t_n)^2 \\
 & \quad - \frac{1}{2} \frac{(1-p)K}{2} H_g(t_n, s_n) (s_n - t_n)^3 \\
 & \quad + \frac{\lambda}{2} \int_0^1 g''(t_n + t(s_n - t_n)) dt (s_n - t_n)^2 H_g^2(t_n, s_n)
 \end{aligned}$$

$$\begin{aligned}
 &\leq \int_0^1 g''(s_n + t(t_{n+1} - s_n))(1-t) dt (t_{n+1} - s_n)^2 + \frac{(2-3p)K}{12}(s_n - t_n)^3 \\
 &\quad - \frac{1-\lambda}{2} \int_0^1 g''(t_n + pt(s_n - t_n)) dt H_g(t_n, s_n)(s_n - t_n)^2 \\
 &\quad - \frac{1}{2} \frac{(1-p)K}{2} H_g(t_n, s_n)(s_n - t_n)^3 \\
 &\quad + \frac{\lambda}{2} \int_0^1 g''(t_n + t(s_n - t_n)) dt (s_n - t_n)^2 H_g^2(t_n, s_n) \\
 &= g(t_{n+1}).
 \end{aligned}$$

Hence, we get

$$\begin{aligned}
 \|y_{n+1} - x_{n+1}\| &\leq \|F'(x_{n+1})^{-1} F'(x_0)\| \|F'(x_0)^{-1} F(x_{n+1})\| \\
 &\leq -g'(t_{n+1})^{-1} g(t_{n+1}) = s_{n+1} - t_{n+1}, \\
 (\text{IV}_{n+1}): \quad \|y_{n+1} - x_0\| &\leq \|y_{n+1} - x_{n+1}\| + \|x_{n+1} - x_0\| \leq (s_{n+1} - t_{n+1}) + t_{n+1} = s_{n+1}, \\
 (\text{V}_{n+1}): \quad \|x_{n+2} - y_{n+1}\| &= \left\| -\frac{1}{2} H(x_{n+1}, y_{n+1}) [I - \lambda H(x_{n+1}, y_{n+1})] (y_{n+1} - x_{n+1}) \right\| \\
 &\leq \frac{1}{2} \|H(x_{n+1}, y_{n+1})\| [1 + \lambda \|H(x_{n+1}, y_{n+1})\|] \|y_{n+1} - x_{n+1}\| \\
 &\leq -\frac{1}{2} H_g(t_{n+1}, s_{n+1}) [1 - \lambda H_g(t_{n+1}, s_{n+1})] (s_{n+1} - t_{n+1}) \\
 &= t_{n+2} - s_{n+1}.
 \end{aligned}$$

So, the sequence $\{x_n\}_{n \geq 0}$ generated by (3) is well defined, $x_n \in \overline{S(x_0, r_1)}$ and $\{x_n\}$ converges to the solution x^* of equation (1) on $\overline{S(x_0, r_1)}$. Now, we prove the uniqueness. If y^* is also the solution of equation (1) in $S(x_0, \alpha)$, then, by the proof of Lemma 1, we know that $g'(t) < 0$, $t \in [0, \alpha]$.

Thus,

$$\begin{aligned}
 &\left\| F'(x_0)^{-1} \int_0^1 F'(x^* + t(y^* - x^*)) dt - I \right\| \\
 &= \left\| \int_0^1 F'(x_0)^{-1} \{F'[x^* + t(y^* - x^*)] - F'(x_0)\} dt \right\| \\
 &\leq \int_0^1 \int_0^1 \|F'(x_0)^{-1} F''\{x_0 + s[x^* + t(y^* - x^*) - x_0]\}\| \|x^* - x_0 + t(y^* - x^*)\| ds dt \\
 &\leq \int_0^1 \int_0^1 g''[s \|x^* - x_0 + t(y^* - x^*)\|] \|x^* - x_0 + t(y^* - x^*)\| ds dt \\
 &= \int_0^1 \{g'[\|x^* - x_0 + t(y^* - x^*)\|] - g'(0)\} dt \\
 &= \int_0^1 \{g'[\|(1-t)(x^* - x_0) + t(y^* - x_0)\|]\} dt + 1 < 1.
 \end{aligned}$$

By the Banach theorem, we know the inverse of

$$\int_0^1 F'[x^* + t(y^* - x^*)] dt$$

exists. Since

$$0 = F(y^*) - F(x^*) = \int_0^1 F'[x^* + t(y^* - x^*)] dt(y^* - x^*),$$

we have $y^* = x^*$. This completes the proof of uniqueness. Thus, the proof of Theorem 1 is complete. \square

Proof of Theorem 2 We know that $F: \Omega \subset X \rightarrow Y$ has the three-order Fréchet derivative. Then

$$\begin{aligned} -H_g(x_n, y_n) &= -g'(t_n)^{-1} \int_0^1 g''(t_n + pt(s_n - t_n)) dt(s_n - t_n) \\ &= \frac{1}{1 - \gamma t_n - \frac{1}{2} t_n^2} \int_0^1 [K(t_n + pt(s_n - t_n)) + \gamma] dt(s_n - t_n) \geq \gamma(s_n - t_n) > 0, \\ &\left\| \int_0^1 F'(x_0)^{-1} \left[F''(x_n + t(y_n - x_n))(1-t) - \frac{1}{2} F''(x_n + pt(y_n - x_n)) \right] dt \right\| \\ &\leq \left\| \int_0^1 \int_0^1 F'(x_0)^{-1} [F'''(x_n + \sigma t(y_n - x_n)) - F'''(x_n)] t(1-t) d\sigma dt \right\| \|y_n - x_n\| \\ &\quad + \frac{p}{2} \left\| \int_0^1 \int_0^1 F'(x_0)^{-1} [F'''(x_n + p\sigma t(y_n - x_n)) - F'''(x_n)] t d\sigma dt \right\| \|y_n - x_n\| \\ &\quad + \frac{2-3p}{12} F'(x_0)^{-1} F'''(x_n) \|y_n - x_n\| \\ &\leq \frac{(1+2p^2)L}{24} \|y_n - x_n\|^2 + \frac{2-3p}{12} N \|y_n - x_n\|, \\ &\frac{(1+2p^2)L}{24} \|y_n - x_n\|^4 + \frac{1}{2} \frac{(1-p)N}{2} (-H_g(t_n, s_n))(s_n - t_n)^3 \\ &\leq \left[\frac{(1+2p^2)L}{6(1-p)} \frac{(s_n - t_n)}{(-H_g(t_n, s_n))} + N \right] \frac{(1-p)}{4} (-H_g(t_n, s_n))(s_n - t_n)^3 \\ &\leq \left[\frac{(1+2p^2)L}{6\gamma(1-p)} + N \right] \frac{(1-p)}{4} (-H_g(t_n, s_n))(s_n - t_n)^3 \\ &\leq -\frac{(1-p)}{4} K H_g(t_n, s_n)(s_n - t_n)^3. \end{aligned}$$

Hence,

$$\begin{aligned} \|F'(x_0)^{-1} F(x_{n+1})\| &\leq \int_0^1 g''(s_n + t(t_{n+1} - s_n))(1-t) dt(t_{n+1} - s_n)^2 \\ &\quad + \frac{(1+2p^2)L}{24} \|y_n - x_n\|^4 + \frac{2-3p}{12} N \|y_n - x_n\|^3 \\ &\quad + \frac{1-\lambda}{2} \int_0^1 g''(t_n + pt(s_n - t_n)) dt(-H_g(t_n, s_n))(s_n - t_n)^2 \\ &\quad + \frac{1}{2} \frac{(1-p)N}{2} (-H_g(t_n, s_n))(s_n - t_n)^3 \\ &\quad + \frac{\lambda}{2} \int_0^1 g''(t_n + t(s_n - t_n)) dt(s_n - t_n)^2 H_g^2(t_n, s_n) \end{aligned}$$

$$\begin{aligned}
 &\leq \int_0^1 g''(s_n + t(t_{n+1} - s_n))(1-t) dt (t_{n+1} - s_n)^2 + \frac{(2-3p)}{12} K(s_n - t_n)^3 \\
 &\quad - \frac{1-\lambda}{2} \int_0^1 g''(t_n + pt(s_n - t_n)) dt H_g(t_n, s_n)(s_n - t_n)^2 \\
 &\quad - \frac{(1-p)K}{4} H_g(t_n, s_n)(s_n - t_n)^3 \\
 &\quad + \frac{\lambda}{2} \int_0^1 g''(t_n + t(s_n - t_n)) dt (s_n - t_n)^2 H_g^2(t_n, s_n) = g(t_{n+1}).
 \end{aligned}$$

Using the same proof method as in Theorem 1, we get assertion of Theorem 2. \square

2 Numerical examples

In this section, we apply the convergence ball result and show two numerical examples.

Example 1 Suppose that $F(x) = \frac{1}{6}x^3 + \frac{1}{6}x^2 - \frac{5}{6}x + \frac{1}{3} = 0$, we consider initial point $x_0 = 0$, $\Omega = [-1, 1]$. We can choose

$$\eta = \gamma = \frac{2}{5}, \quad N = \frac{6}{5}, \quad L = 0. \quad (7)$$

Hence,

$$K = N = \frac{6}{5}, \quad \beta = \frac{2(\gamma + 2\sqrt{\gamma^2 + 2K})}{3(\gamma + \sqrt{\gamma^2 + 2K})^2} = \frac{3}{5}, \quad \eta < \beta. \quad (8)$$

Moreover, by Theorem 2, we get that the sequence x_n ($n \geq 0$) generated by (3) is well defined and convergent.

Example 2 Consider the following integral equations

$$x(s) = 1 + \frac{1}{4}x(s) \int_0^1 \frac{s}{s+t} x(t) dt \quad (9)$$

and the space $X = C[0, 1]$ with the norm

$$\|x\| = \max_{0 \leq s \leq 1} |x(s)|. \quad (10)$$

This equation arises in the theory of the radiative transfer, neutron transport and in the kinetic theory of gasses. Let us define the operator F on X by

$$F(x) = \frac{1}{4}x(s) \int_0^1 \frac{s}{s+t} x(t) dt - x(s) + 1. \quad (11)$$

Then, for $x_0 = 1$, we get the following results:

$$N = 0, \quad L = 0, \quad K = 0, \quad \|F'(x_0)^{-1}\| = 1.5304,$$

$$\eta = \|F'(x_0)^{-1} F'(x_0)\| = 0.2652,$$

$$\gamma = \|F'(x_0)^{-1} F''(x_0)\| = 1.5304 \times 2 \cdot \frac{1}{4} \max_{0 \leq s \leq 1} \left| \int_0^1 \frac{s}{s+t} dt \right| = 0.5303,$$

$$\frac{2(\gamma + 2\sqrt{\gamma^2 + 2K})}{3(\gamma + \sqrt{\gamma^2 + 2K})^2} = 0.9429 > \eta,$$

this means that the hypotheses of Theorem 2 hold.
